LINE

OF

PROPORTION OF NUMBERS,

Gunter's Line,

MADE EASIE:

By which may be measured all manner of Superficies and Solids; as Board, Glass, Pavement, Timber, Stone, &c.

ALSO,

How to perform the same by a Line of Equal Parts, drawn from the Centre of a Two-Foot-Rule.

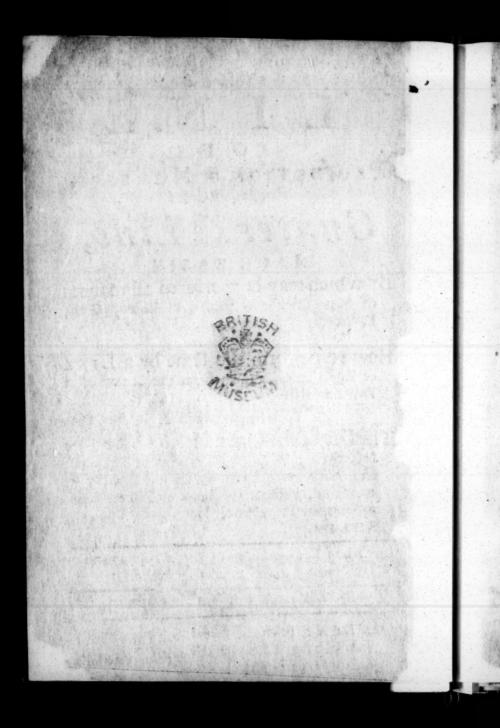

Whereunto is added,

The Use of the Line of Proportions
Improved: Whereby all manner of Superficies
and Solids, may both exactly and speedily be
measured, without the help of Pen or Compassess, by Inspection, looking only upon the
RULER.

The Ninth Edition carefully Corrected, and other new Ways of Measuring added.

By WILLIAM LEYBOUR

LONDON: Princed by and for T

TO THE

READER.

類談

DISTRIBUTE

or Numbers, commonly called (by Artificers)
Gunter's Line, hath been discoursed of by several

Persons, and variously applied to divers
Uses: For when Mr. Gunter had deduced it from the Tables of Logarithms,
to a Line, and written some Uses thereof, Mr. Wingate added divers other of
the same Lines, variously disposed,
hereby to Extract the Squite or Cube
Roots, without doubling or trebling the
distance of the Compasses. After him,
Mr. Milbourn, a Yorkshire Gentleman,
disposed it in a Serpentine or Spiral

To the READER.

Line, thereby enlarging the Division. Again, Mr. William Oughtred dispofed this Line in a Circle, as also the Lines (or Scales) of Artificial Sines and Tangents, in other concentrick Circles with it; and writ the Uses of them in Latin; which were afterwards Translated into English, by Mr. William Forster, and Printed under the Title of Mr. Oughtred's Circle of Proportion. Alfo Mr. Seth Partridge contrived two Rulers, to slide one by the side of the other, baving upon them two. Lines of one length; which exactly and readily performeth all Operations wrought thereby, without the help of Compasses.

Now what soever all the forementioned Contrivances will perform, I have here shewed in the Manual; and soordered the Line, that it will perform the Work without Compasses, by Inspection, looking only upon the Ruler. And thereby may be measured (let the Line be of what length soever) not only Board, Glass, Timber and Stone, but also all

manner

To the READER.

manner of Hangings, Pavements, Wainfcots, Plaistering, Tyling, Brick-work,
&c. To all which Uses I have particularly applied it, as will appear by several Examples in all the forementioned
Particulars; and the rather, because
this Treatise may be beneficial and useful as well to Gentlemen and Others, who
may have occasion to make use thereof,
in Buying or Selling of Timber, either
standing, or felled, and squared; as to
Artificiers themselves, for whose Sakes
chiefly it was intended.

And therefore, in the first Part of this Treatise (aster the Use of the Vulgar Carpenter's Rule) I have shewed the Use of the Line of Proportion, which Artisticers commonly call Gunter's Line, from the Name of that Man who first contrivid it; (and as it is now generally put upon the Flat or Edge of all Carpenters Rules) first, in working of the several Rules of Arithmetick, as Multiplication, Division, the Extraction of the Square and Cube Roots; and in the working

To the READER.

of the Golden Rule, or Rule of Proportion, whereby the Mensuration of all Superfices and Solids; as Board, Glass, Pavements, &c. and of Solids, as Timber, Stone, &c. and performed by the Rule and a pair of Compasses: And afterwards by some of those other Contrivances, I have before mention'd in this Preface to the Reader, and afterwards more at large in their due Places; to which and the rest of this Manual I refer.

Vale.

How

How to Measure

BOARD and TIMBER

Carpenter's Plain Rule.

A LL manner of Superficial and Solid Measures, may be measured the most absolute and artificial Ways that are yet known, by the Precepts and Examples in this Book delivered: But altho' every Capacity may not attain to the knowledge and understanding thereof, I thought good here to insert the Use of that Rule, which is commonly made and sold, and which every Artificer continually carries about him.

A 4

Its

Its DESCRIPTION.

I. Of the FORE-SIDE.

It confisteth of two flat Sides, one of which towards either edge thereof, is divided into 24 equal Parts, called Inches, and numbered by 1, 2, 3, 4, and fo on to 24, at the end thereof. Every one of these Parts or Inches is again divided into two equal Parts, by Lines about half the length of the other, representing half Inches; and every of these half Inches is divided into two other equal Parts, called Quarters of Inches; and each of those again into two other equal Parts, call'd Half-quarters of Inches : So that each Inch is divided into 8 equal Parts, representing Inches, Halves, Quarters, and Half-quarters.

Both the Edges on the one fide of the Rule are thus divided and num-

hred,

bred, only where 24 ends at one end of the Line on one Edge, there i begins on the other Edge; so that which end of the Rule soever you measure with, you may count your number of Inches and Parts right, without turning of the Rule.

II. Of the BACK-SIDE.

On the other fide of the Rule you have two other Lines, or Scales, drawn near to the Edges of the fame Side: One is called, The Line of Timber-measure. At the beginning of either of these Lines you have a little Table in Figures, the one for Board, the other for Timber or Stone.

The Line or Scale of Board-meafure begins at 6, towards your Lefthand, and so goes on to 36, ending A 5 juil

gives

just 4 Inches short of the other end of the Rule; but sometimes this Line is continued up to an hundred, but not often, and then it goes nearer to the end of the Rule, namely, to with in an Inch and an half of the end thereof. At the beginning of this Line there is a small Table from 1 to 6 Inches, which shews in (Figures) the quantity of the length of a Foot of any board, from 1 Inch broad, to 6 Inches board; and then the Divisions supply the greater Breadths.

On the other Edge on the same Side, you have the Line or Scale of Timber-measure. This Scale begins at 8 and an half, and so goes on (by Divisions) to 36, towards the other end of the Rule, namely, 36 ending within almost an Inch and an half of the Rule's End. To this Scale also there belongerh a Table, which standeth at the beginning of the Line, and goes from 1 Inch, to 8 Inches, and gives

gives the quantity of the length of a Foot of any Timber or Stone, under 8 Inches square in Figures, as the other did for Board, from 1 to 6. And these are called, The Tables of Undermeasure.

The TABLE for UNDER-BOARD-MEASURE

1	2	13	4.	5	10
12	6	14	3	2	2
0	0	10	0	4	0

The TABLE for UNDER-TIMBER-MEASURE.

0	0	10	0	0	10	111 3

Thus much for the Description of

the Lines upon the Carpenter's Plain Rule. Now for

Their USE.

I. Of the Fore-fide, or Side of Inches.

This fide is only to measure the Length and Breadth of any thing to be measured in Inches and Parts; the manner of doing thereof is natural to every Man: For taking the Rule in the left Hand, apply it to the Thing to be measured; so have you the Length, Breadth, or Thickness of the Thing desired. But,

21212121611611612

II. Of the Back-fide.

AND.

I. Of the Line of Board-measure.

The Breadth of any Board being given, to find how much thereof in Length will make a Foot Square.

Look for the Number of Inches that your Board (or Glass) is broad, in the Line of Board-measure; and the Number of Inches and Parts of an Inch, which stand against that, on the other fide of your Rule, is the quantity of Inches that will make a Foot square of that Board, " or Glass, or what other Thing foever it be to be meafured.

half on thorads bus 2010

Example side much in league of that breadth

will make a Foot Coure.

Example

Example 1. There is a Board or Plank that is 9 Inches broad, how much of that in length will make a Foot Square?

Look for 9 Inches upon the Line of Board-measure (which you shall find at the Figure 9, upon the same Line) and just against that, on the other side of your Rule, you shall find 16 Inches, which shews that every 16 Inches of that Piece in length, will make a Foot square.

Example 2. A Pane of Glass is 22 Inches broad, How much thereof in length make a Foot square?

Look for 22 Inches in the Line of Board-Measure, and right against it (on the other fide of your Rule you) shall find 6 Inches, and almost an half; and so much in length of that breadth will make a Foot square.

Example

Example 3. If any plain Superficies be 30 Inches broad, How much thereof in length will make a Foot square?

Seek for 30 Inches in the Line of Board-Measure, and right against it, on the other Side of the Rule, you shall find 4 Inches and 4, that is, 4 Inches, and 4 fifth Parts of an Inch.

Example 4. If a Board be 9 Inches and a half broad, How much thereof in length will make a Foot fquare?

Seek 9 Inches and an half, in the Line of Board-Measure, and against that on the other side of the Rule you shall find 15 Inches, and about 1 sixth part of an Inch, to make a Foot square.

¶ NOTE. All these Examples might be performed otherwise by the Line; for if you take the Rule in

in your Left-haud, and apply the end thereof, noted with 36, to the end of the Superficies to be measured; the other edge of the Superfices will shew how many Inches, Halves, and Quarters will make a Foot square. This needs no Example.

PROBL. II.

The Length and Breadth of a Superficies being given, to find how many square Feet are therein contained.

By any of these ways (before taught) find how much of the breadth given will make a Foot square; then run that length from one of the ends of the Superficies as often as you can, and so many square Feet are there in that Superficies.

soul sent take the Hule

Example

Example. A Board is 9 Inches broad, and 15 Foot long; How many square Feet are there contained?

By the first Example, you find that at 9 Inches broad, 16 Inches in length do make a Foot: Wherefore take 16 Inches of your Rule, and run that length along the Board from one end thereof, and you shall find that length to be contained in the Board of 15 Foot long, 11 times, and 4 Inches over, which is 10 fa Foot; so that the Board of 15 Foot long, and 9 Inches broad, contains 11 Foot and one Quarter. The like of any other.

II. Of the Line of Timber-measure.

PROBL. I.

The Square of any Piece of Timber at the end thereof being given, to find how much of that Piece in length will make a Foot solid.

The

The Use of the Line of Timbermeasure, is in all respects the same as that of Board-measure; for knowing the square of your Piece of Timber at the end thereof, you have no more to do than to look for the quantity of the square thereof in the Line of Timber measure; and right against it on the other side of the Rule, you have the quantity of Inches that will make a Foot solid of that Piece.

Example 1. A Piece of Timber is 10 Inches square, how much thereof in length will make a Foot solid?

Look for 10 Inches in the Line of Timber-measure, and right against it on the other side of the Rule, you shall find 17 Inches and somewhat above a Quarter of an Inch; and so much of that Piece in length will make a Foot solid.

Example

Example 2. If the Square of a Piece of Timber be 2.1 Inches, How much thereof in length will make a Foot solid?

Seek 21 Inches in the Line of Timber-measure, and against it you shall find, on the other side of the Rule, almost 4 Inches; and so much in length will make a Solid Foot of Timber.

Note. 1. If Timber be broader at one end than at the other, the usual way is to add both ends together, and take half thereof for the true Square: But if the difference be very much, this way is erroneous, though for the most part practifed.

Note 2. Also for round Timber, the usual way is to girt it about the middle with a String, and take a fourth part thereof for the square; this also is erroneous: Therefore, for such as desire defire Curiofity and Exactness, let them repair to the Rules in this Book delivered for that Purpose, where they may receive ample Satisfaction.

Concerning the Tables at the beginning of the Lines of Board and Timber-measure.

The Table of Board-measure gives the length of a Foot square of any Board under 6 Inches broad; therefore by the Table there set you may find that.

Foot In. Parts.

This small Table you may see that a Board of 4 Inches broad, will require 3 Foot thereof in length to make

of 5 Inches broad will require 2 Foot, 4 Inches, and 4 fifth part of an Inch.

The Table of Timber-measure gives the length of a Foot solid, of any piece of Timber or Stone, whose square is under 8 Inches: Wherefore, by the Table at the beginning of the Line of Timber-measure, you may find that

Foot In. Parts.

By this Table (which is the same in effect with that which standeth at the end of the Line of Timber-measure) you may see that a piece of Timber that is 4 Inches square, requires 9 Foot in length to make a solid Foot: Also a piece of 5 Inches square, requires

of an Inch, to make a Foot folid. And fo of the rest.

But because these Tables go only to whole Inches, I have here added two Tables, one for Board, the other for Timber, the Table for Board, from one quarter of an Inch to 6 Inches in breadth; and the Table for Timber, from two Inches square to 8 Inches, by Inches, Halves, and Quarters.

The TABLES follow!

The first water from the first of the first

Lutely Published,

A Arithmetick made Easy, for the Use and Benefit of Trades-Men. Wherein the Nature of Fractions both Vulgar and Decimal, are Taught by a New and Exact Method. Also the Mensuration of Solids and Superficies. The Seventeenth Edition. By F. Ayres, late Writing-Mafter inSt. Paul's Church-Yard, London. To which is added, a Shorr and Easy Method; after which Shop-keepers may State, Post, and Balance their Accompts. By Charles Snell, Writing-Master, and Accomptant, in Fosterlane, London. The Whole perused, and carefully Corrected By E. Hatton, Gent. London: Printed by and for Tho. Norris, and fold at the Looking-glass on London-bridge. And for Dan. Midcointer, at the Three Crowns in St. Paul's Church-Yard, 1726. Price Bound One Shilling.

THE

THE

LINE

Q F

Proportion, or Numbers;

Commonly called

GUNTER'S LINE, MADE EASY.

HAT this Line is, and how to make it, is best known to those who make Mathematical Infiruments; but the Uses

of it are so general, that all Sorts of Men of what Faculty soever, may apply in to their particular Uses; tho it more immediately and particularly concerns such Artificiers whose Em-

T

ploy-

ployment confifts in Mensuration: As Carpenters, Joyners, Majons, Bricklayers, Painters, Glasiers, and such' like; for that all kind of Mensura. tions, either SUPERFICIAL, as Board, Glass, Pavement, Tyling, &c. or SOLID, as Timber, Stone, Columns, Pyramids, &c. are by this Line most easily, speedily and exactly perform'd : For whatfoever thing, concerning Meafure, that may be performed by Arithmetick, by this Line will do exactly, and much fooner; as by the working of several Rules in Arithmetick, by this Line, shall be plainly made appear.

CHAP. I.

NUMERATION.

Before I shew you how to number upon the Line, it will be necessary to let you understand how the Line Line is divided and numbred, as also what those Divisions and Numbers set to them upon the Ruler, do signify.

Know therefore, that the Line of Numbers begins at the Figure One, and so proceeds successively from 1 to 2, 3, 4, 5, 6, 7, 8, 9, to 10, (or 1 in the middle of the Line; and then on farther, by 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, at the end of the Line.

The first 1, which stands at the beginning of the Line, representeth the one tenth part of any Unit or Integer, as one tenth part of a Foot, one tenth part of a Tard, Ell, Perch, Mile, &c. Or it may signify one tenth of a Year, Month, Hour, &c. Or the one tenth of a Pound, Shilling, or Penny, &c. Or the one tenth part of any thing, either in Number, Weight, Measure, Time, or the like. The Figure 2, signifies two tenth Parts of any thing: The Figure 3, three tenth Parts: The Figure 4, four tenth parts, &c. till you come to the second

the Line; which one fignifieth One whole Unit or Integer, as one whole

Foot, Yard, Perch, &c.

Now the other intermediate Divifions, those which stand between the Figures 1 and 2 (which are in number ten) do represent (each of them) one hundredth part of one Unit, or Integer; so the first Division beyond the Figure 1, represents 1 hundred Parts of the Integer; the fecond Division, 11 hundred parts of the Integer; and fo on: The Figure 2 reprefenting 20 hundred parts of the Integer; and the next Division beyond 2, is 21 hundred Parts, and fo on, till you come to the Figure 1 in the middle of the Line, which representeth one whole Integer. The Figure 2, fignifieth two whole Integers, the Figure 3, three whole Integers, and fo on till you come to so at the end of the Line, which fignifieth Ten whole Integers; and the intermediate Divisions, which stand bebetween 1 and 2 in the middle of the Line, are (every of them) tenth parts of the Integer. So the Rule contains Ten whole Integers, every of which is divided into ten Parts.

But if upon the Line you would count Numbers of more places than two (which are all Numbers above 10) then the 1 which is at the beginning of the Line, must be accounted one Integer; and the 1 in the middle of the Line, ten Integers; and the 10 at the end, will be 100 Integers.

But yet farther, if upon the Line you would express Numbers of more places than Three (which are all Numbers above 100) then the 1 at the beginning of the Line is to be accounted ten Integers; the 1 in the middle One bundred Integers; and the 10 at the end of the Line, One thousand Integers, &c.

And if you proceed yet farther; then the 1, at the beginning, must be accounted for One bundred Integers;

B 3 that

that in the middle, one thou fand; and the 10 at the end of the Line, for

ten thousand Integers.

In this manner you may proceed farther, by counting the first 1 for 1000, 10000, &c. Integers; but to four places is sufficient; which by a Rule of competent length (as of two Foot) any Question concerning Measuring, may exactly enough perform'd.

The Divisions and Numbers on the Line being thus explained, it resteth now to shew you how to find that Point upon the Line, which shall represent a Number proposed; and that I shall shew you in these Propositions following, which may fitly be called, NUMERATION.

PROP.

And the you proceed yet faither; then the t, at the beginning, must be accounted tor Ore handred three three

of one hand out the overest and the to

PROP. I.

A whole Number confishing af Two, Three, or Four Places, being given; to the Point upon the Line which representesh the same.

OTE, let your Number given be of how many places soever; for the First Figure of your Number, you must take the same Figure upon the Line : For the Second Figure in your Number, take the Number, thereof on the grand (or larger) intermediate Divisions on the Line. For the Third Figure in your Number, take the Number thereof on the smaller intermediate Divisions on the Line. And for your fourth Figure, you must find its place by estimation; by suppoling the space or distance of the intermediate Division to be divided into 10 parts, according to the nature of the Line.

B 4

Example I. Let it be required to find the Place of I apon the Line.

For your first Figure 1, count the 1, in the middle of the Line: Then for the 5, which is your fecond Figure, count five of the grand (or larger) intermediate Divisions upon the Line, and that Point is the very place upon the Line representing 15.

Note, That every fifth of the grand intermediate Di visions is drawn forth with a longer Line than the reft, for ease in counting.

Again, To find the place upon the Line repre-Senting 37. For your first Figure 3, count the Figure 3, which Itands between the I in the middle, and 10 at the end, upon the Line;

then for the 7, count 7 of the intermediate Divisions and that Point is the place upon the Rule representing

37.

Example II. Let it be required to find the place of 134 upon the Line.

For your first Figure 1, count the I, in the middle of the Line; for your fecond

fecond Figure 3, count three of the grand Divisions; and for the third Figure 4, count 4 of the smallest intermediate Divisions, and that very point is the place upon the Line represent-

ing 134.

Again, To find the place representing 308. For your first Figure 3, count the three which stands between the middle r and 10 upon the Line: For your fecond Figure o (which is a Cypher) count none of the grand Divisions; but for your last Figure 8, imagine the first grand Division following the Figure 3, to be divided into 10 parts, and imagine 8 of them in your mind; and that point shall be the place upon the Line representing 308. Example III. Let it be required to find the place of 1350.000 001

For your first Figure 1, take 1 on the middle of the Line: For your fecond Figure 3; take the Figure 3 upon the Line upwards for the 5, count five of the grand intermediate Divi-

fion; and that is the place of 1350;
Again, To find the place of 1626:
For your first Figure 1, count the ron the middle of the Line; for your second Figure 6, count the Figure 6 upon the Line upwards: then for your third Figure 2, count two of the grand Divisions; and for your last Figure 6, estimate fix tenth parts of the next grand Division (which is something more than half the Distance, because 6 is more than half ro.) and that is the Point upon the Line representing 1626.

Note, By these Examples last mentioned, you may perceive, that the Figures 1, 2, 3, 4, 5, 6, 7, 8, 9, do sometimes signify themselves alone, sometimes 10, 20, 30, &c. sometimes 100, 200, 300, &c. as the Work performed thereby shall require. The significant which is here set down, and the rest of the Figures are to be supplied according as the nature of the Question and I require.

And

And by this variation and change of the Powers of these Numbers from 1 to 10, or 100, or 1000, any Proportion, either Arithmeticial or Geometrical, may be wrought. One thereof I will insert, for your better exercise of numbering on the Line; by the often practice thereof, you will find the Work facile and delightful; which shall be this following.

PROP. II.

Having two Numbers given to find as many more as you please, which shall be in Continual Proportion one to another, as the two Numbers given, were.

Place one Foot of the Compasses in the first guen Number in the Line, and extend the other Foot to the second given Number; then may you turn the Compasses.

passes from the second Number to a third, from that third to a fourth, from that fourth to a sifth, a sixth, a seventh, &c. to what Number of Places you please.

Example I. Let the two given Numbers be 2 and 4.

Place one Foot of your Compasses in 2, at the beginning of the Line, and extend the other Foot to 4; then that Foot which now standeth in 2, being turned about, will reach from 4 to 8, and from 8 to 16, from 16 to 32, from 32 to 64, from 64 to 128.

But when your Compasses stand in 64; if you turn them about yet farther, they will fall beyond the end of the Line; therefore you must place one Foot in some other 64, nearer the beginning of the Line, and then the other Foot will reach to 128, and from 128 to 256, and from 256 to 512, and from 512 to 1024: But here it will go off of your Line again, where-

wherefore (as before) you must chuse another 512 nearer the beginning of the Line; and there placing your Compasses, they will reach to 1024, from 1024 to 2048, from 2048 to 4096, &c.

Example II. But if the given Number

were 10, and 9 Decreafing;

Then place one Foot in 10 at the end of the Line, and extend the other downwards to 9; the same extent will reach still downwards to 8.1 (for 8.1) and from 8.1 to 7.29, and still downwards from 7.29 to 6.59.

Likewise, if the two first Numbers had been as 1 to 9, the third Proportional would have been 81, the fourth 729, and the fifth 656, with the same

extent of the Compasses.

Again, Let the two Numbers be 10 and 12: Place one Foot in 10, and extend the other to 12, that extent will reach from 12 to 144, and from thence to 17.28.

But

But if the Numbers were 1 and 12, the the third Proportional would be 144, and the fourth 1720, and all with the same extent of the Compasses.

CHAP. II.

MULTIPLICATION by the LINE.

IN Multiplication, the Proportion, is this: As a upon the Line,
Is to one of the Numbers to be multiplied:

So is the other of the Numbers to

be multiplied,

To the Product of them, which is the Number fought:

Example I. Let it be required to multiply 5 by 7.

The Proportion is;
As I: Is to 5:: So is 7: To 25.

There-

Therefore, fet one Foot of your Compasses in 1, and extend the other Foot to 5; with that extent of the Compasses place one Foot in 7, and the other Foot will fall upon 35, which is the Product.

Example II. Let it be required to mul-

The Proportion is;

As 1: To 9:: So 32: To 280.

Set one Foot in 1, and extend the other Foot to 9; that fame extent will reach from 32 to 281, which is the Product or Sum of 32, being multiplied by 9. Otherwise,

Set one one Foot in 1, and extend the other to 32; the same extent will

reach from 9 to 288, as before.

Example III. Let it be required to mul-

tiply 8 ... by 6 4.

The Analogy or Proportion is,

As 1: To 8.75:: So 6.45: to 56.44.

So one Foot in 1, and extend the other to 8.75; the fame extent applied

plied forward upon the Line will

reach from 6.45, to 56.45 feré.

Or if you let one Foot in 1, and extend the other to 6.45: the same extent will reach from 8.75 to 56.44 almost (namely, to 43 ½) as before.

CHAP. III.

DIVISION by the Line.

IN Division three Things are to be minded, viz.

Dividend, or Number to be di-

vided.

The Divisor, the Number by which the Dividend is divided.

Quotient, which is the Number fought.

And, as often as the Divisor is contained in the Dividend, so often doth the Quotient contain Unity.

For

For the working of Division, this is the Analogy, or Proportion.

As the Divisor, is to Unity, or 1, So is the Dividend, to the Quotient.

Example I. Let it be required to Di-

The Proportion is,

As 7: to 1:: 10 35: to 5.

Set one Foot of the Compasses in 7, and extended the other Foot downwards to 1; that same extent will reach from 35 downwards to 5, which is the Quotient; and so many times is 7 contained in 35.

Otherwise, extend the Compasses upwards from 7 to 35; that same extent will reach upwards from 1 to

5, as before.

Example II. Let it be required to didivide 288 by 32.

The

The Proportion is,

As 42: to 1 :: 10 288 : to 9.

from 92 to 1, the same extent will reach downwards from 288 to 9,

which is the Quotient.

Or extend the Compasses upwards from 32 to 288; the same extent will reach upwards from 1 to 9, as before.

Example III. Let it be required to divide 56.34. by 8.75.

The Proportion is,

As 8.75: to 1:: fo 55.44: to 6.45. Extend the Compasses downwards from 8.75 to 1; the same extent will reach downwards from 56.44. to 6.45.

Or, extend them upwards from 8.75, to 56.44; the same will reach upwards from 1 to 6.45, as before.

Note this in Division. That so many times as the Division may be orderly fet under the Dividend in Arithmetical

rical Work, so many Places of Figures shall be in the Quotient of your Division: As if 34785 were to be divided by 75, the Quotient shall consist of Three Figures only, namely of 463, because 75 can be but three times set orderly under 34785, in Arithmeticial Operation.

The GOLDEN RULE Direct by the Line.

Golden Rule, it being the most useful of all others; For having three Numbers given, you may, by it find a fourth in proportion to them; as by divers Examples following shall be made plain. And this Rule is performed upon the Line with the like Ease and Exactness, as any of those before mentioned: And for the working of it upon the Line, this is the general AN A-

ANALOGY, or PROPORTION.

As the First Number given,
Is to the Second Number given:
So is the Third Number given,
To the Fourth Number required.
Or,

As the First Number given: So is the Second Number given, To the Fourth Number fought. Wherefore.

Always, Extend the Compasses from the First Number to the Second, and that Distance, or Extent, applied the same way upon the Line, shall reach from the Third, to the Fourth Number required.

Or, otherwise, Extend the Compasses from the first Number to the Third, and that Extent applied the same way, shall also reach from the Second to the

Fourth.

GENERAL RULES.

Either

Either of these ways will effect the same things, as by Examples follow-

ing shall be made appear.

And it is necessary thus to vary the Proportion, sometimes to avoid the opening of the Compasses too wide: For when the Compasses are opened to a very large extent, you can neither take off any Distance exactly, nor give so good an Estimate of any parts required, as you may do when they are opened to a lesser Distance: But this you will find out best by Practice; and therefore I will now proceed to Examples.

Example 1. If 45 Yards of Cloth cost

Example 1. If 45 Yards of Cloth cost 30 l. what will 84 Yards cost at the

Same rate.

As 45: to 30:: 10 84: to 56.

Extend the Compasses from 45, downward to 30, that extent will reach downward from 84 to 56 l. the Price of 84 Yards.

Or, extend the Compasses upwards from 45 to 84, the same will reach from 30 to 56, as before. Ex-

Example 2. If 26 Acres of Land be worth 64 La Year; what are 36 Acres of the like Land worth by the Year?

As 26: to 64:: 10 36: to 88.615.

Extend the Compasses from 26 to 64, the same extent will reach from 36 to 18 10.5 Parts (which is about 12 s. 3 d. 2 q.) and so much are 36 Acres of the like Land worth by the Year.

Example 3. If 100 l. yield 6 l. Interest for one Year, or 12 Months, what shall 75 l. yield?

As 100: to 6: : 10 75: to 4.50.

Extend the Compasses from 100 to 6, the same extent will reach from 75 to 4.50 (or 4½) which is 4 1. 10 5. and so much will 75 1. yield Interest in the Year.

Example 4. If 75 l. yield 4 l. 10 s, Interest for one lear, or 12 Months, what will a 100 l. yield?

As 75 : to 4.40 :: fo 100 : to 6.

from 75 to 4.50, the same extent will

reach from 100 to 6; and fuch Interest will 100 L yield.

Many other Questions might be added; but the Rule (and manner of working it) is so plain, that it needs them not; and so general, that he which can resolve one, may as well resolve another: And therefore I shall say no more of it in this Place.

Modern C. H. A. P. V.

The GOLDEN-RULE Reverse by the LINE.

In this Reverse or backward Rule of Three, this Note is especially to be observed. That if the Third Number be Greater than the First, then will the Fourth Number be Less than the Second. And on the contray; If the Third Number be Less than the First, then the Fourth Number

ber will be greater than the second: As by Examples will appear.

Example 1. If any 12 Workmen, do any Piece of Work in 8 Days, bow many Workmen Shall do the Same Piece of

Work in 2 Days?

It is here to be noted, That in this Question, 12 is not the first Number (though it be first named) but 2; for the middlemost Term of the three must be of the same kind with the fourth Number, which is to be fought; as in this Example it is Men, therefore 12 (which are Men) must Stand in the middle, or Second place, because the fourth Number, which is to be fought, is also Men: And therefore the Numbers stand thus;

> days. days. men. 2 1 12

For if 8 Days require 12 Men, then 2 Days (which is but a fourth part of 8 days) shall require four times 12

Men, that is 48 Men.

For here, Less requires More; that is, Less Time, More Hands: and hence the Work is contrary to the Direct Rule. Wherefore to effect it, this is

The RULE.

Extend the Compasses from the Third Term, to the First: The same Extent will reach (being turned the contrary way) from the Second Term to the Fourth.

Or, The extent from the First Term to the Third, will reach (the same way)

from the Second to the Fourth:

As in this Example.

Extend the Compasses from 8 downwards to 2, the same extent will reach from 12 (the contrary way on the Line) to 48, which is the Number of Men that will effect the same Piece of Work in two Days.

Or, Extend the Compasses from 2 to 8, the same extent will reach

(the fame way) from 12 to 48, as before.

Example 2. If I Close will graze 21
Horses for 6 Weeks, how many Horses will the same Close graze for 7
Weeks?

Extend the Compasses from 6 to 7; for you must always extend your Campasses to Numbers of one kind or denomination; as here 6 and 7 are both Horses, the same Extent will reach from 21 backward to 18; and so many Horses will the same Close graze for 7 Weeks.

CHAP. VI.

of DUPLICATE PROPORTION
by the Line.

DUplicate Proportion is such a Proportion as is between Lines and Superficies, or between Superficies and Lines.

I. Of

I. Of the Proportion of LINES to SUPERFICIES.

The RULE.

Extend the Compasses from the First, to the Second Number of the same Denomination; that same extent (being doubled) shall give the distance from the Third Number unto the Fourth.

Example 1. If the Diameter of a Circle be 14 Inches, and the Area or Content thereof be 154 Inches; what will be the Content of another Circle, whose Diameter is 28 Inches?

Extend the Compasses from 14 to 28; that extent doubled, will teach from 154 to 616: For first it will reach from 154 to 308, and from thence to 616: and that is the Area of Content of a Circle whose Diameter is 28.

Example

Example 2. If a Piece of Land that is 20 Pole square, be worth 30 l. what is a piece of Land of the same Goodness worth, that is 35 Pole square? Extend the Compasses from 20 to 35; that extent doubled will reach from 30 to 91.8, that is, 91 l. 50 of a Pound, which is 16 s. and so much is a piece of such Land worth.

II. Of the Proportion of SUPERFICIES
to LINES.

The RULE.

Extend the Compasses unto the half of the distance between the two Numbers of the same Denomination; the same extent shall reach from the Third Number to the Fourth required.

Example 1. Let there be two Circles giwen, the Area or Content of the one being 134, and its Diameter 14: The Area of the other Circle is 616; what is the length of its Diameter?

Upon

Upon your Line divide the distance between 154 and 616 into two equal parts; then with that distance set one Foot in 14, and the other shall fall upon 28, which is the length of the Diameter of the other Circle, whose Area is 616.

Example 2. There is piece of Land containing 20 Pole square worth 30 l. there is another piece worth 9.1 l. 16 s. how many Pole square ought that

piece to contain ?

Take with your Compasses half the distance between 30 1 and 911. 16 s. then set one Foot in 10 Pole and the other Foot will reach to 35 Pole; and so many Pole square must the Land be that is worth 911.16 s.

Of TRIPLIGATE PROPORTION, by the Line.

Riplicate Proportion is such Proportion as is between Lines and Solids, or between Solids and Lines.

II. Of the Proportion of SOLID to

The RULE.

Extend the Compasses unto the third Part of the Distance between the two Numbers of like Denomination; that same Extent shall reach from the Third to the Fourth Number required.

Example. The weight of a Cube being 72 pound, the Side whereof was 8 Inches; and the weight of another Cube of the same matter weighing nine pound, what must the Side be?

Upon your Line divide the diftance between 9 and 72 into three equal parts; then fet one Foot of that diftance in 8, and the other Foot shall rest in 4, the length of the Side of the Cube required.

C4 CHAP.

CHAP. VIII.

The Extractioion of the SQUARE-ROOT by the Line.

find a Mean Proportional Number between I and the Number given; and therefore is to be found by dividing the Space between them to two equal Parts.

Example: Let it be required to find

the Square Root of 36.

Extend the Compasses from 1 to 36, the middle way upon the Line between these two Number is 6, which is the Square-Root of 36. In like manner you may find the Square-Root of 81 to be 9, of 144 to be 12, of 256 to be 16; and of other Numbers, as in this Table.

The fact of day yet	A SECTION OF STREET	CA CAMPAGE AND AND ST	The state of the contract of the state of th	
Root.	Square.	Root.	Square	
i i si	id Torbus	10	DT 121	
2	4	12	144	
3	9	13	169	
4	16	14	195	
5	25	15	225	
6	36	16	256	
7	49	17	289	
7 8	1 64	18	324	
9	81	119	351	
10	100	2.0	400	

If you suppose the Number to have Pricks over every second Figure, as is usual in the Arithmeticial Operation, then if the last prick towards the lest Hand fall over the last Figure (which will always be when the number of Figures are Odd) then it will be the best to place Unity at the I in the middle of the Line, so that the Root and the Square may both fall forwards towards to at the end of the Line.

Just case third proof that distance that it is the

Caber

But if the Number of Figures be Even, it will then be best to place Unity at 10 at the end of the Line; so the Root and the Square both will fall backwards towards the middle of the Line.

CHAP. IX.

The Extraction of the CUBE-ROOT,

find the first of two mean Proportionals between 1 and the Number whose Cube-Root you require; and is therefore to be found upon the Line, by dividing the space between them into the three equal Parts. Example. Let it be required to find the Cube-Root of 216.

Extend the Compasses from 10 to 216, one third part of that distance shall reach from 1 to 6, which is the Cube-

(35)

Cube-Root of 216. In like manner you may find the Cube-Root of 729. to be 9, of 1728 to be 12, of 110592 to be 48, of 493039 to be 79, &c. as in this TABLE.

Root.	Cube.	Root.	Cube:
1	1 1	11	1331
2	8	12	1721
3	27	13	2197
4	64	14	2744
5	125	15	3375
6	216	16	4096
7	343	17	4913
8	512	18	5832
9	729	19	6859
10	1000	20	8000

Now because it is troublesome in the Square-Root to divide the space into two, and in the Cube-Root into three equal Parts, you may (if you have often Occasion for this Work) have on your Rule other Lines of Numbers; as once twice, and another thrice so long as the other; and then this Work may be wrought upon the Lines

Lines, without dividing the distance upon the Line.

CHAP. X.

The Use of the LINE applied to Superficial-Measure, such as Board, Glass, Wainscot, Pavement, Hangings Painting, &c. of what kind soever.

HE Measure by which Board, Glass, Timber, Stone, and such like are measured, is by the Foot, a Foot containing 12 Inches; and each Inch into eight Parts, called Halves, Quarters, and Half-quarters: But this kind of Division not being consentaneous or agreeable to the Divisions upon your Line of Proportion; where between 1 and 2 is divided (not into 8, but) into 10 Parts, the like between 2 and 3 into 10 Parts, and so between 3 and 4.4 and

and 5, &c. Therefore I hold it tequifite, both for ease and exactness, to have every Inch on your Two-foot Rule divided, not into 8, but into 10 equal Parts, which hereafter (throughout this Book) we will call

Inch measure.

Again, Whereas your Foot is divided into 12 equal Parts call'd Inches, I would have your Foot divided into 10 equal Parts, and each of those Parts subdivided into 10 other equal parts, so will your whole Foot contain a 100 equal parts, which will be agreeable to the Divisions of your Line, and faciliate the Work, as by the Examples in this kind given will be made to appear; and this we shall hereafter call Foot-measure.

But if any Person be so wedded to Inches, Halves and Quarters, that he will not be beaten out of his Opinion, but persist therein, and yet is desirous to have knowledge in the Use of this Line; I say, such Person may have ad-

ded

ded to the fide of his Inches, Halves, and Quarters (by way of Facing, as I term it) a Line of Foot-measure, and also his Inches into 10 as well as 8, so that he may measure by one, and work upon his Line by the other. And this indeed will be necessary to be done, upon the Rules of those ingenious Artificers who need them not; for that they many times meet with wilful Persons, that will have them to measure their way, how disconfentaneous to Reason soever it be.

In this nature would I have the Rule divided; and in this manner have I caused them to be made, both for myself and others: And a Figure of a Foot an Inch measure I have inserted towards the beginning of the Book.

And here note, that what is here faid concerning dividing the Inch and Foot into 10 Parts, the like is to be understood of the

the Tard, Ell, Pole or Perch, or any other Measure whatsoever.

These things being premised, we

will now proceed to Examples.

I. Examples in Inch measure only.

Example 1. Let a Board or Plank
be 27 Inches broad, and 263 Inches
long; bown many square Inches is there
in such a Plank? The Proportion is,

As 1, is to 27, the breadth in In-

ches:

So is 263, the length in Inches, To 7101, the number of square Inches in the whole Plank.

Extend the Compasses from 1 to 27; the same extent, forwards, will reach from 263, to 7101, the Content.

Of, you may extend the Compaffas from 1 to 263, the same will reach from 27 to 7101, as before.

Example 2. Let a pane of Glass be 53.4. Inches broad, and 126.8 Inches long; bow many Foot is there in that pane?

The

The Promortion is,

As 144 (because 144 Inches make 1 Foot)

Is to 35.4, the breadth in Inches: . So is 126.8, the length in Inches, To 47.06, the Content in Feet.

Extend the Compasses from 144 downwards to 534; the same will reach (the same way) from 126.8, to 47.06, which is 47 Foot, and 200 parts of a Foot, the contents of the whole Pane.

Example 3. If a Marble Footpace or Walk be 20 Inches broad, how much in length of that will make a Foot fquare?

The Proportion is,

As 20, the breadth in Inches, 1000

So is a Foodt unto the length of one Foot in Inch-measure.

Extend the Companies from 20 to 144; that extent will reach the fame way from 1 to 7/2: so that 7 Inches and 7 of that breadth will make a Foot square.

II. Example in Foot-measure only.

Example 1. Let a Floor or Stone-pavement by 52 Foot broad, and 110.5, Foot long, how many foot square is that Floor or Pavement?

The Proportion is,

As I Foot,

to 52 Foot the breadth:

So 100.5 Foot the length,

to 5746 the Content in square Feet.

Extend the Compasses from 1 to 52, the same will reach from 110.5, to 5746, the Content of the Pavement or Floor in square Feet.

Example 2. There is a Plank of Cedar 2 Foot 25 parts broad; how much in length thereof will make a Foot square? The Proportion is,

As 2.25 the breadth,

is to 1:

So is 1, or any number of Feet, to the length of a Foot-square in Foot-measure. Extend

Extend the Compasses from 2.25 to 1; that extent will reach back from 100, which is one Foot, to 44 parts; and fo many parts in length of that Plank will make a Foot. like manner 88 parts will make 2 Foot, I Foot 32 parts will make 3 Foot, &c. For,

As 2.25 is to I Foot:

III. Examples in Inch-measure and

Foot-measure together.

Example 1. Let a Board be 30 Inches broad; and 15 Foot and or 25 parts long; how many Foot square doth Such a Board or Plank contain?

The Analogy is,

As 12 Inches.

to 30 the breadth in Inches:

So 15.25, the length in Feet,

to 28.125, the content in-Feet.

Extend the Compasses from 12 to 30, the same will reach from 15.25

to 38.125; and so many Foot square is contained in such a Plank.

I will conclude this Chapter with this useful and necessary Problem,

Namely:

By having the length and breadth of anylong square, or Parallelogram given; to find the length of the side of a Geometrical Square equal thereunto.

This by the Line is eafily effected; for if you take the half-distance upon your Line between the length, and the breadth, the Number upon which the Compass point resteth shall be the length of the side of the Geometrical Square equal to the

Note, By a long Square or Paralleogram is meant any Square, whose Sides are longor than one another, as any long Table, etc. But a Gemetrical Square is that whose 4 sides are all of one length and the Angles all square as right Angles.

long Square, or Parallelogram.

Example. Let the longer fide of the Parallelogram be 183 Inches, and the

the breadth 30 Inches: If you divide the Distance upon your Line between these two Numbers into two equal parts, the Compass-point shall rest upon 74 Inches 10 Parrs: So that a Geometrical square, whose side is 74.10, shall be equal in Area to a long-square, whose sides are 30 and 183.

So if you multiply 183 by 30, the Product will be 5490, whose Square-Root is 74.1. And 74.1, multiplied by 74.1, produceth 5490.81, which is 5490.1, as near as can be estimated

A CAMPAGE COLLEGE

SUPPLEMENT.

To the Use of the Line of Proportion, or Numbers: But more particularly to this 10th and the 17th Chap. foll-lowing; performing the more difficuty Problems concerning Superficial and Solid Measures (as Board, Timber, Stone, &c.) far more Easily Expeditionally, and Exactly, than by the Way there directed.

TOR the effecting whereof it will be necessary (and so I would advise every Artificier) to have upon his Two-foot-Rule (besides the common Double-line of Numbers, as it is usually put upon all Two-foot Rules) one other Single-Line of Numbers of

one Radius, which must be exactly the length of the other two, which are upon the common two-foot Rules; By which means these following) and many other Problems) will be far more easily and accurately performed than they can by the Common Double line alone. I shall give you Examples of some few of them, whereby the rest and (several others) will be the better apprehended.

PROP. I.

Having the Length and Breadth of a Parallelogram or Long-square, given; to find the length of the side of a Geometrical Square, whose superficial Content shall be equal to the long Square.

His hath relation to what is done in the Tenth Chapter. And,

I. In Inch-MEASURE.

Let the length of the Parallelogram be 183 Inches, and the breadth 30 Inches. This is the Third Example of the Tenth Chapter before going.

Take with your Compasses (out of the Double-line of Numbers) the Distance between 30 the Breadth, and 183 the Length, the Compasses opened to this Distance; Set one Foot in 30 (the leffer fide) and the other will reach (upwards) to 74.1, in the fingle Line of Numbers; and that is the Side of a Geometrical Square equal to the Parallelogram: Or,

The Compasses being opened from 30 to 183, in the Double-line; If you fet one Foot in 183 (the greater fide) the other will reach (downwards) to 74.1 Inches, the Side of the Geome-

trical Square.

II. In Foot-measure.

Let there be an Oblong Superficies, whose Breadth let be 7.25 Foot, and its Length 32.5 Foot: what shall the side of a Geometrical Square be, whose Area shall be equal to the given Paral-

lelogram?

Take in your Compasses the distance between 7.25 (counted in the lower part of the Double-line) to 32.5 (counted in the upper part:) Then set one Foot in 32.5 counted in the Single-line) and the other will reach (downwards) to 15.25. Foot, the side of the Geometrical Square required.

Example 2. Let there be a Parallelogram, whose length is 25.5 Foot; and breadth 12.3 Foot: what is the side of a Geometrical Square equal thereunto?

PROB.

E

PROP. II.

TO find the true Square of unequal fided Timber or Stone.

I. Inch-measure.

Example 1. There is a squared Piece of Timber, whose Breadth at the End is 13.2. Inches, and Depth 9.5 Inches: What is the side of a Square equal thereunto?

Take out of your Double-Line the distance between 95 and 13.2. With this distance, upon the Single-Line, set 1 Foot in 13.2, and the other will reach downwards to 11.1 Inches; the side of the Square required.

Example 2. There is a Stone whose Sides at the End are 11 Inches and 18 Inches: What is the fide of the Square equal thereto?

Take the distance between 11 and 18, out of the Double-Line, and that D will

will reach from the Single-line from 11 (upwards) or from 18 (downwards) to 14.70 Inches, which is the fide of the Square required.

II. In Foot-measure.

Example 1. There is a squared piece of Timber, whose sides at the end thereof are 2.25 Foot, and 3.75 Foot: what is the side of a square equal to

the End thereof?

dismo

The distance between 2.25 and 3.75, taken out of the Double-line, will reach from the Single-line from 2.25 (upwards) or from 3.75 (downwards) to 2.9 Foot, which is the fide of the Square required.

III. Of tapering Timber.

This hath Relation to the Work of the 17th Chapter following; and for it this one Example following shall suffice.

Exam-

Example. Let there be a pece of squared taper Timber, whose sides at the greater End are 3.6, and 2.8 Foot; at the lesser End 2.5, and 1.7 Foot; and the length thereof 23.4 Foot.

r. Extend the Compasses from 1, to 2.8, the same extent will reach from 3.6, to 10.08 Foot, the Area

of the Greater End.

2. Extend the Compasses from 1, to 1.7, the same will reach from 2.5 to 4.25 Foot, the Area of the Lesser End.

3. Take the distance (upon the Double-line) between 4.25, and 10. 8; that distance applied to the Single-line, will reach from 4.25 to 6. 54 (the Geometrical Mean between the Areas of the two Ends.

4. Add the two Areas and this Geometrical Mean together, and their

Sum will be 20.87.

JULY!

of g themle at Digw

The

Iner Orada

Cof the greater End, 10.80 The Area of the leffer End, 4.25 Cthe Geomet. Mean, 6.54

Their Sum 20.87

Now the Length of the Piece being 23.4 Foot, one Third part there-

of is 7.8 Foot: Wherefore,

5. Extend the Compasses from I to 7.8 Foot (which is One Third part of the Length of the Piece) that Extent will reach from 20.87 (the Sum of the Areas and Mean before found) to 162.78 Foot: And that is the true Content of the whole Piece of Timber, which is 162 Foot, and somewhat about a quarters of a Foot.

Note, If this Piece had been meafured by adding the Areas of the two Ends together, and taking the half of them, and multiplying that Half by the Length of that Piece, the Quantity would be found to be 167.66 Foot, which is almost 5 Foot

more than it should be-

What

What is faid here concerning Tapering Timber squared, the like is to be understood of Round Tapering Timber, or Timber-Trees growing.

CHAP. XI.

Of TARD-MEASURE by the Line.

ANY Artificers, as foyners, Painters, Plaisterers, Pavers, Upolsterers, &c. measure and sell their Work, not by the Foot, but by the Yard: It will be necessary to give Examples in this kind of Measure also. And here also it is requisite, that your Yard be divided into 100 Parts and not into Halves, Quarters, and Nails: Which supposed, take these Examples following.

Miller at Franch

Exam-

Example 1. A Joyner hath Wainscotted a Gallery containing 130 Yards 25 parts about, and in height 15 Yards 50 parts 5, how many square Yards are in that Gallery?

The Proportion is.

As 1 yard,
to 15.50 yards the height:
So 130.25, the Compass in yards,
to 20.18.87: and so many square
yards.

Extend the Compasses from 1 to 15.50, the breadth, the same extent will reach from 130.25, the length, to 20.1887: and so many square yards of Wainscotting are in that Gallery.

Example 2. A Painter bath painted a Landskape, or other Work, over the Wainscot of a Room, which is 1.75 parts of a Yard deep; how much in length thereof will make a Yard square?

As

As the breadth 1.75,

Is to I yard, or 100 parts:

So is 1, or any other Number of yards,

To the length of a yard square.

Extend the Compasses from 1, in the middle, upwards, to 1.75; the same extent will reach from 100 (or one yard) at the end, downwards to 57.14: and so much in length of that painting will make a yard square.

Example 3. A Plaisterer bath laid and beautified a Cieling, containing 13 yards broad, and 63 yards, 30 parts long, how many square yards are

there in that Cieling?

As I Yard.

To the breadth 13.30,

So the length 63.30,

To the Content.

Extend the Compasses from 1 to 13; the same extent will reach from 63.30, to 823 almost: and so many square yards are there in such a Cieling.

D 4 Note,

Note, It may fo fall out sometimes, that it may be required to meafure some piece of Work, and to give an estimate of the quantity of the Yards therein contained, when you have not a Yard thus divided by you, but only your Two-soot Rule, for the supplying whereof, I would add this following Problem.

PROBLEM.

The length and breadth of any Supersicies being given in Feet, to find the Content thereof Yards.

Let the breadth of a piece of any Work, to be measured by the Yard, be 4 Foot, and the length thereof 12 Foot, how many square Yards are contained therein?

The Analogy or Proportion is, As 9, the Feet in one Yard, is to 4, the breadth in Feet,

Nore

So is 12, the length in Feet, to 5.33, the content in Yards.

Extend the Compasses fram 9 to 4, the same extent will reach (the same way) from 12 to 5.33 that is, to 5 Yards and 33 hundred parts of a Yard, which is 3 Yards, one Quarter, and almost half a Quarter of a Yard.

And what is here faid of measuring by the Foot, and giving of the Content in Yards, the same may be effected if the Dimensions be taken in Feet, and the Result required in Ells, or other Measure.

CHAP. XII

Of LAND-MEASURE by the Line.

THE usual Measures for Land are Chains, of which there are divers Sorts; but the Denominations D 5 that

that the quantity of Land is given in by, are Acres and Perches.

The Chains now most in use are

principally two,

One containing I Seach of them di-Perch in length Vided into 100 Ches in length, Links.

For the Practice of them take these

Examples.

I. By the One-pole Chain.

Example 1. There is a plat of Ground 30 Perches broad, and 183 Perches long; how many Perches doth it contain?

As I,

Maria I

So 183 the length, in Perches, to 5490, the Content in Perches.

Extend the Compasses from 1 to 30, that extent shall reach from 183 to 5490, the Content in Perches.

EX-

estample 2. But the length and breadth of the same piece of Ground being given as before in Perches; if it were required to find the Content in Acres, Then the Proportion will be,

As 160 Perches,

So 183, the length in Perches,

to 34.31 Acres.

Extend the Compasses from 160 to 30; the same extent will reach (the same way) from 183 to 34.31, that is, 34 Achres, 31 hundred parts of an Acre, which is something above a Rood.

II. By the Four-pole-chain.

Example 1. A Piece of Land containing 16 Chains, 25 Links in breadth and 57 Chains, 30 Links in length, how many Acres doth it contain ? The Analogy is, As 10,

to 16.25, the breadth in Chains, and Links;

So is 57-30, the length in Chains, to 93-11255 Acres, and parts of an Acre.

Extend the Compasses from 10 to 16.25, the same extent i ill reach from 57.3, to 93.11255; that is 93 Acres, and 11255 parts of an Acre.

Example 2. The Base and Perpendicular of a Triangle being given in Chains and Links, to find the Content in Acres.

This is a right, useful and necessary Proposition: for by it all manner irregular Plats of Land are cast up: But my Intent here is not to teach Surveying, but to shew the Use of the Line of Proportion.

wherefore let the Perpendicular of a Triangle by 7 Chains 50 Links, and the Base 45 Chains 75 Links, the Proportion will be.

As

As 2,

to 7.50, the Perpendicular:
So is 45.75, the Base,
to 17.15, the content in square
Chains.

Extend the Compasses from 2 to 7.50, that extent shall reach from 45.75: to 17.15, which is 17 Acres, and 15, parts.

Example 3. Having the length of any Furlong given, to find what breadth

it must have to make an Acre.

Let the length of the Furlong be 12 Chains 50 Links; then to find the breadth for one Acre, this is the Analogy;

As 15.20, the length in Chains,

is unto 10:

So is a Acre.

to 80 Links, which must be the breadth of the Furlong.

Wherefore,

Extend the Compasses from 1, in the middle upwards, to 12.50, the same will reach from 1 in the middle, down-

downwards to 80 links, the breadth of the Furlong.

PROB.I.

THE Area, or Superficial Content
of any piece of Land being given,
according to one kind of Perch; To
find bow much the same Piece of
Land would contain, if it were measured with a Pole or Perch of another
Length, different from the former.

Like Plains are in Proportion to another, as are the Squares of their Homologal Sides. And therefore, the Proportion to refolve this Problem is

this following, viz.

Lows

our of

As the Square of the Perch (Rad or Pole) by which the Land is to be measured,

Is to the Square of the Pole, or Perch,

So is the Area (or Content) given,

To the Area (or) Content required.

Ex-

Suppose a Wood (or other Piece of Land) has been measured by a Chain of 18 Foot, to the Rood, Pole or Perch; and by such a Chain it was found to contain 61. Acres, and 3 tenth parts of an Acre: And it were required to fine how wany Acres the same Piece of Land would contain, if it had been measured by a Pole, Rood or Perch, of 16 Foot and a half, which is the Statute-Pole or Perch.

The Proportion is,
As the Square of 16.5 Foot, (the
Pole by which the Land is to be

measured) which is 172.25,

Is to the Square of 18 Foot (the Pole or Perch by which the Land was measured) and is 224;

So is 61.3 Acres (the quantity as measured by the 18 Foot Ferch;)

To 73, (the quantity of Acres that it would contain, if it had been meafured, by a Statute-Pole of 16.5. Foot. Where-

Wherefore,

Extend the Compasses from 16.5, to 18; the same extent will reach (the same way) from 61.3 Acres (the Content given; to another numbeer (viz. 6.63) upon the Line; and from that other Number forward, to 73 Acres, the Content if measured by a Statute-Pole of 16.5 Foot.

But (on the contrary) if the Piece being measured by Chain of 16.5 Foot, should have contained 73 Acres, and it had been required to know how many Acres it would have contained, if it had been measured by a Chain of 18 Foot to the Pole; then, the Operation upon the Line would be

thus;

Extend the Compasses from 18 (downwards) to 16.3; the same extent will reach the same way, (viz. (downwards) from 73 Acres to a Fourth Point (or Number) upon the Line: And from that Point (or Number) downwards to 16.3 Acres;

And such would they quantity of Acres have been, if it had been measured by a Customary Pole or Perch of 18 Foot.

PROB. II.

The Area, or Content of any Plot of Land being given; and the Scale by which it was laid down, being either Omitted, Lost, or Conceal'd: To find the Scale by which it was plotted. Let there be given you the Figure of a piece of Land, which is said to contain 8 Acres, and if you would know by what Scale it was laid down, or Plotted; do thus;

First take any Scale (as suppose one of 12 Pole in an Inch) and cast up the Content of the Plot thereby; and so doing, suppose you find the same Plot to contain 11.5 Acres, that is 11 Acres and a half: And now, to find the true Scale by which it was plotted, this is the Analogy or Proportion.

As the quantity of Acres found, by the Scale of 12(viz. 11.5 A.)

Is to the Square of the Scale 12. (viz. 144;)

So is the quantity of Acres given, (viz. 8,)

To 105, the Square of the Scale by which it was plotted, (vis. 10-)

If you extend the Compasses from 11.5 Acres downwards to 8 Acres. The same extent will reach from 114 (downwards to 10, the Scale by which the Ground was laid down or plotted.

CHAP. XIV.

Of the Menfuration of divers Regular SUPERFICIAL FIGURES by the Line.

H Aving fufficiently shewn the manner of measuring of fuch

Superficial Figures as are measured by length and breadth, I will now shew you how by the Line to measure some other Regular Figures, as the Circle, &c.

I. of the Circle.

Example 1. The length of the Diameter of any Circle being given, to find the Circumference thereof.

The Proportion between the Diameter, and the Circumference of any Circle is as 7 to 22 5, or in exacter terms, as 1.000 to 3.14.

Wherefore,

If the Diameter of a Circle be 12 Inches, the Circumference thereof may be found by this following Analogy:

As 1.000,

Is to 3.14:

So is 12 the Diameter, to 37.68, the Circumference.

Where-

Wherefore extend the Compasses from 1.000 to 3.14, the fame extent will reach from 12 to 37 Inches, 68 parts; which is the Circumference.

Example 2. The Circumference of any Circle being given, to find the

length of the Diameter.

This is the converse of the former Examples, and the Analogy is the converse also.

Let the Circomference of a Circle by 37 Inches 60 Parts, what is the length of the Diameter?

As 3.14, .4 1.8 01 000.1 30 ,300191

to 1.000: 200 start W

So is 37 Inches, 68 Parts the Circumference,

to 12 Inches, the Diameter.

Extend the Compasses from 3.14, downwards, to 1.000; the fame extent will reach, the same way, from 37.68, to 12, the Diameter required. in cum interence bariug

Ex-

Example 3. Having the Diameter of a Circle, to find the length of the Side of a Square which shall be equal in coment to the same Circle.

If the Diameter of a Circle be 12

Inches, the Proportion is,

As 1.000,

Is to 12 Inches, the Diameter;

So is 8862,

To 10.63, the fide of the Square.

Extend the Compasses from 10000 (or from I in the middle) upwards, to 12, the Diameter, the fame extent will reach from 8862, counted in the lower part of the Line, upwards, to 10 Inches, 63 hundred Parts, the fide of a Square equal in Area to the Circle, whose Diameter is 12 Inches.

Example 4. Having the Circumfetence of a Circle given, to find the side of a Square equal to that Circle.

Let the Circumference of the given Circle by 37 Inches, 68 Parts:

The Proportion is,

As 10000, to 37.68, the Circumference: So is 2827.

to 10.63, the fide of the Square.

Extend the Compasses from 10000 (or 1 in the middle) upwards to 37.68, the same extent will reach from 2821 upwards, to 10 Inches, 63 parts, the side of the Square required.

Example 5. The Diameter of a Circle being given to find the Superficial Content thereof.

Let the Diameter of a Circle be

15 Inches.

Extend the Compasses from 1 to 15, The Diameter; then apply one Foot of that distance (always) to 78. 54, and turn that distance twice from this Number, the same way, and the Compass point will fall upon 176 Inches, 74 parts; which is the Area of that Circle whose Diameter is 15 Inches.

Example 6. The Circumference of a Circle being given, to find the Area thereof.

Let the Circumference of Circle

given be 47 Inches 13 parts.

Extend the Compasses from 1, to 47.13, the Circumference; this distance being applied (always) to this Number 7958, and from thence twice repeated, the point of the Compasses at the second remove, will fall upon 176 Inches, 74 parts, equal to the Area of the Circle, as before.

Here note, That your Compasses being opened from 1 to 37.13, the Circumference, when you come to set one Foot upon 7958, the other will reach at your first turning over to 29.75; and when you turn them over again, it will fall out of the Line: Therefore you must set one Foot in 29.55, in the lower part of the Line; and then the other will fall upon 176 74; and this you must do in other Cases.

Cases whenever your Compasspoint goes beyond your Line.

CHAP. XV.

II. Of the TRIANGLE

A Triangle is a Figure confisting of three Sides and three Angles, the longest Side whereof we call the Base; and a Line drawn from the Angle opposite to the Base we call the Prependicular.

To measure Triangles there are several ways; I would only shew you one or two to be done by the Line.

Example 1. There is a Triangle whose Base is 14 Foot, and his Perpendicular is 6 Foot; I would know how many square Feet are contained in this Tringle.

The Proportion is, 10 and

1. As

1. As 2, VI W 11 13 is to 6, the Perpendicular; So is 14, the Base, to 42, the Area.

2. As 1. is to 3, half the Bafe; So is 14, the Base, to 42, the Area. Or,

2. As 2. is to 6, the Perpendicular; So is 7, half the Base, to 42, the Area.

Or. 4. As I,

is to 6, the Perpendicular; So is 14, the Base, to 84, the double Area.

All these Ways produce the same Effect; but the first is the best:

Wherefore,

The Base of the Triangle being 14, and the Perpendicular 6,

For the First way,

Extend the Compasses from 2 to 6; the same extent will reach from 14 to 42, the Area.

For the Second way,

Extend the Compasses from 1 to 3; the same extent will reach from 14, to 42.

For the Third way,

Extend the Compasses from 2 to 6; the same extent will reach from 7, to 42.

For the Fourth way.

Extend the Compasses from 1 to 6; the same extent will reach from 14, to 84; which is the double of 42, the Area.

III. Of the Trapezium.

A Trapezium is any right lined Figure confifting of 4 numeral Sides, and as many equal Angles.

For the measuring of it, you must full reduce it into two Triangles, by draw-

drawing a Line or Diagonal from one opposite Angle to another, the longest way; then from the two Angles opposite to this Line, let fall two Perpendiculars; so in the Trapezium divided into two Triangles. The manner how to measure it, is as followeth.

Example. There is a Trapezium, whose Diagonal is 12.34, and one Perpendicular is 4.20, the other 5.70; I would know the Content or Area thereof.

The two Perpendiculars added together; make 9.27. Then the Analogy is,

As 2,

is to 9.27, the Sum of the Perpendiculars;

So is 12.34, the Base or Diago-

nal to 57.17, the Area.

Extend the Compasses from 2, to 9.27; the same extent will reach (the same way) from 12.34, to 57.

2 17

17, which is the Area, or Superficial

Content of the Trapezium.

There are as many ways to meafure Trapeziums, as in the last Example I—gave you for Triangles; but this is the best.

And here note, That if you are to measure any irregular Piece. of what nature soever, whether Land, Board, Glass, Pavement, or the like, your best and exactest way is to reduce them to Trapeziums, and measure them as before is taught.

IV. Of Regular Figures of 5, 6, 8, 10, or 20 equal Sides.

These Figures by Geometricians, are called Regular Polygons; and the way to measure them, is by adding all the Sides together: Then measure the length from the Centre of the Figure, to the middle of one of the Sides. By the help of these two you may find the Area of the Figure: as followeth.

Polygon of 11 equal Sides, each Side being 7 Inches, and let the length of the Line from the Centre, to the middle of one of these Sides, be 12 Inches.

Add all the Sides together, they make 77; then,

AS 2,

is to 77, the Sum of the Sides; So is 12 Inches the length of the Line from the middle of the Figure.

to 462, the Content of the Figure.

Extend the Compasses, from 2, in the under part of the Line, to 77, (counted also in the under part of the Line:) The same extent will reach from 12 (counted in the up-

per-part of the Line) to 462, which is the true Content of the Polygon in Feet.

CHAP. XVI.

The Use of the LINE applied to SO-LID MEASURES, such as Timber, Stone, &c

Imber and Stone are usually measured by the same Rule or Measure as Board and Glass are, namely, by Feet and Inches: Therefore such a Rule as was mentioned in the beginning of the Tenth Chapter, is sit for this Business also.

Before we come to shew the way of Measuring of Stone or Timber, it will be necessary to premise thus much; That the Base or End of every piece of Timber or Stone is (or must be supposed) either exactly square, that is, every Side alike, or else one of the Sides longer than the other: Wherefore the first thing to be done, is to find the Area or Superficial Content

Content of the Base, or end of any Piece of Timber or Stone to be meafured; which may be done feveral ways, either in Inch-measure, as by the first Example of the first part of the Tenth Chapter; or in Foot-measure, by the first Example in the second part of the same Chapter; or both in Foot-Measure and Inch-measure, as in the first Example of the third part of the same Tenth Chapter, and therefore need not here be repeated again. Wherefore, we will proceed to our intended purpose of Measuring, first, by Inch-measure only; secondly, by Foot-measure only, and thirdly by both together: As we did before in the Measuring of Board, &c.

2100 E14 8

MINNA

I. In

I. In Inch-meafure only

Example 1. There is a piece of Timber 30 Inches broad, 21 Inches, 6 Paris deep, and 183 Inches long; how many square Inches are there in this solid piece of Timber?

The Proportion is,

1. As 1,

is to 30 Inches the Breadth; So is 21.6 Inches the Depth,

is to 648, the Content of the Base of the Piece.

2. As 1.

is to 684 the Content of the Base; So is 183 Inches, the length of the Piece.

to 118584, the solid Content in In-

Wherefore, Extend the Compaffes from 1 to 30, the breadth; the fame will reach from 21.6, the depth, to 648, the Content of the Base.—

Again,

Again, Extend the Compasses from 1 to 648, the Content of the Base is that extent will reach from 183, the length, to 118584 Inches, the solid Content. But so many places of Figures can't well be estimated upon your Line, except it be very large: But by the following Examples you shall have your defire accomplished exactly and easily.

Example 2. To find the Content of the fame piece of Timber in Foot-meafure the Dimensions being given in

Inches and Parts?

The Proportion is,

1. As 1,

is to 30, the Breadth; So is 21.6, the Depth,

to 648, the Content of the Bafe, as before.

2. As 1728, the number of folid Inches in a Foot of Timber,

is to 648, the Content of the Bafe;

So is 183, the length in Inches,

to 68 Foot, and 42 parts of a Foot, as before. E 5 Where-

Wherefore, as before, extend the Compasses, from 1, to 30, the Breadth, the same will reach from 21.6, the Depth, to 648, the Con-

tent of the Base, as before.

Again, extend the Compasses from 1728, (calling the 1 in the middle of the Line 1000) downwards to 648, the Base (counted in the under-part of the Line:) The same extent will reach the same way, from 183, the length) counted in the upper-part of the Line) downwards, to 68.62, the Content of the piece of Timber in Feet and Part, that is, 68 Foot, and above half a Foot.

Example 3. Let a square Stone, or piece of Timber be 30 Inches broad, and 21 Inches, 6 parts deep; how much in length shall make a Foot square of that piece of Timber or

Stone.

You may find the Content of the Base, as in the last Example, to be 648 linches: Then the Proportion is

As

As 648, the Content of the Base, is to 1728, the Inches in a Foot;

to 2 Inches, 67 Parts, the length

of a Foot folid.

Therefore extend the Compasses from 648, the Base, to 1728; the same will reach from 1 to 2.67: So that 2 Inches, 67 Parts, will make a Foot solid of that piece of Timber or Stone.

This may be done another way, by this Analogy or Proportion.

1. As 12,

is to 30, the breadth in Inches, So is 21.6, the depth in Inches, to a fourth Number (which here will be about 54.)

2. As the fourth Number 54,

is to 144;

So is 1,

to 2.67, the length of a Foot folid.

Wherefore extend the Compasses from 12 to 30, the breadth, that extent

tent will reach from 21.6, the depth, to a certain place upon the Line (about 54) where keep the Point of the Compass fast, and open the other to 144; then will this extent of the Compasses reach from 1 to 2 Inches, 67 parts, the length of a Foot solid as before.

II. In Foot-measure only.

Timber be 2 Foot, 50 Parts broad, 1 Foot, 80 Parts deep, and 25 Foot, 15 Parts long, bow many folid or cubical Feet doth fuch a Piece contain?

The Proportion is,

is to 2.50 Foot, the Breadth:
So is 1.80 Foot, the Depth,
to 4.50 Foot, the Base in Footmeasure.

is to 4.50, the Base;
So is 15.25, the Length,
to 68.62, the Content in Feet.

Ex-

Example 2. In the forementioned piece of squared Stone or Timber being 2 Foot, 50 Parts broad, and 1 Foot, 80 Parts deep, Let it be required to find how much thereof in length will make a Foot.

The Proportion is,

1. As 1,

is to 2.50, the Breadth;

So is 1.80, the Depth,

to 4-50, the Content of the Base,

2: As 4:50, the Bafe,

billis to I, wide O ym

So is I Foot,

to 222 parts, the Length of a Foot

Wherefore, Extend the Compaffes from 1, at the beginning of the Line, to 250, the breadth; the same Extent will reach from 1.80, the depth in the under-part of the Line, to 4.50, the content of the Base.—

Again, Extend the Compasses from 4.50, the Base, (counted in the up-

per-part of the Line) downwards to 1, in the middle of the Line; the fame will reach from 10, at the end of the Line, downwards, to 222 parts, the Length of a Cubical or Solid Foot of that Stone or Piece of Timber.

III. In FOOT-MEASURE and INCH-MEASURE together.

Example. Let a squared Stone or piece
of Timber be 30 Inches broad, 27.6
Inches deep, and 15 Foot, 25 parts
long; How many Cubical or Solid
Foot of Stone or Timber are there in
that Piece?

The Proportion is,

is to 30 Inches, the Breadth;
So is 21.6 Inches, the Depth,
to 640, the Content of the Base
in Inches.

to 450, the content of the Ba(e. **cA**A-**g**in, Extend the Compasses from 450, the Base (counted in the ap2. As 144 the Inches in a Foot Superficial,

is to 648, the Content of the Base in

Inches:

So is 15.25, the length of the Piece in Foot-measure,

to 68 Foot, 62 Parts.

Wherefore extend the Compasses from 1 to 30, the Breadth: the same will reach from 21.9, the depth, to 648, the Content of the Base.

Again, Extend the Compasses from 144, to 648, the Content of the Base; the same extent will reach from 15.25, the length of the Piece, to 68.62, the solid Content of the Stone or Timber in Feet, and 100 parts of a Foot.

By having the same things given in the same piece of Stone or Timber (or in any other) the Work may be varied several ways: The Analogies or Proportions I, will only give you, leaving the Practice there-

of to yourfelf.

Breadth

Breadth of the Piece. 30 Inches. Depth of the Piece, 21.6 Inches. Length of that Piece, 15.25 Foot. The Proportion is,

is to 30, the Breadth-So is 21.6, the Depth, to a fourth Number-

From which fourth Number, if you extend your Compasses to 1, and place one Foot in 15.25, the length of the Piece, the other Foot shall fall upon 68.62, the Content of the Stone.

Or,

2. As 12, is to 30, the Breadth; So is 12.6, the Depth, to fome fourth Number.

From this fourth Number extend the Compasses to 12, that distance will reach from 15.25, the length of the Piece, to 68.62, the Content of that Piece.

CHAP.

CHAP. XVII.

How to measure Stone or Timber by the Line, by having the Square of the Base, and the Length of the Piece given, both in Foot and Inchmeasure.

HOW to find the Length of a Side of a Geometrical-Square, that shall be equal to any Parallelogram, or Long-Square, is taught at the latter end of the Tenth Chapter of this Book, by which Rule it may at any Time be found. That being done there, I shall only here begin with Examples.

Example 1. There is a squared Piece of Timber, whose Length is 183 Inches, and the side of the Square, equal to the Base or End thereof, is 25 Inches, 45 Parts; how many

Foot doth that Piece contain?

is to 25.45, the fide of the Square; So is 183, the length in Inches, to a fourth Number,

the

fide

fro

otl

wh

de

ab

2. And that fourth Number, to 68.82, the Content in Feet.

Extend the Compasses from 41.57, to 25.45, the side of the Square; the same will reach from 183, the length, to some other part of the Line; from whence if you again extend the same distance, the Point will rest from 68 Foot; 62 parts of a Foot; and so many Foot are in the Piece.

Example 2. Let the side of a Square, equal to the Base of a piece of Stone or Timber, be 2 Foot, 12 parts, and the length of the same Piece 15 Foot, 25 Parts; how many solid Foot are there in that Piece?

1. As 1,

is to 2 Foot, 12 Parts, the fide of the Square;

So is 15 Foot, 25 parts, the length, to a fourth Number; 2. And 2. And that fourth Number, to 68.62, the Content in Feet.

Extend the Compasses from 1, in the middle, upwards, to 2.12, the side of the Square; that will reach from 15.25, the length to some other Number on the Line: From whence the Compasses being extended (or turn upwards) the moveable Point will fall from 68.62, the Content, as before.

Example 3. The side of a Square, equal to the Base of a Stone, being 25 Inches, 45 Parts, and the length of that Stone 15 Foot, 25 Parts, how many

Foot doth it contain?

7. As 12,

is to 25.45, the square in Inches: So is 15.25 Foot the length, to a fourth Number:

2. And that fourth Number, to 68.62, the Content.

Extend the Compasses from 12 to 25.45, the side of the Square; the same will reach from 15.25, to some other whence the Compasses being extended or turned upwards, the moveable Point will fall upon 68 Foot, 62 Parts, the Content of the Stone.

Example 4. There is a piece of Timber whose side of the Square of the Base is 25 Inches, 45 Parts, how much in length of that Piece will make a Foot solid?

1. As 25.45, the fide of the Square,

is to I Foot;

So 41.57, to a fourth Number.

2. And that fourth Number,

to 6 Inches, 67 Parts-

Wherefore, Extend the Compasses from 25.45, the side downwards, to 1 in the middle of the Line; the same will reach from 41.57, downwards to some other Point, from whence the Compasses being turned still downwards, will reach to 667, the length of a Foot Solid of that Piece of Timber.

Ex-

fr

Example 5. The length of the side of a Square equal to the Base of a piece of Timber being 2 Foot, 12 parts, to find how much in length of that Piece will make a Foot solid in Foot-measure.

As 2.12, the fide of the Square, is to 100;

So is 1.00,

to a fourth Number.

Total Control

2. And that fourth Number, to 222 parts of a Foot, to make a Foot iquare,

Extend the Compasses from 2.12, the side of the Square, downwards to 100; the same extent will reach from 100, downwards to some other Point upon the Line, and from thence still downwards, to 222, parts of a Foot; and so much in length will make a Foot solid.

CHAP.

CHAP. XVIII.

Concerning Timber that is bigger at one end than at the other, either Round or Square; and how to meafure it.

I. For SQUARED-TIMBER.

IN large Timber-Trees, when they are squared, there is a great disproportion between the Squares of both ends; wherefore some do use to take the square of the middle of the Piece for the mean or true square, but this is not exact, though much used; but the best way is this. Find by the Problem at the end of the Tenth Chapter of this Book, the length of the side of a Square equal to both the ends of the Piece, add these two sides together, and take the half thereof for the true Square:

21

fe

t

be

m

gr

and with that Square you may by the Rules of the last Chapter meafure it as if it were persectly square.

But this way is not exact neither: For it is not the Arithmetical Mean, but the Geometrical Mean, which gives the true Square: As by the Suppliment at the end of the Tenth Chapter you may see.

II. For ROUND-TIMBER.

The ordinary way used for the measuring of Round-Timber, is to girt it about the middle with a Line, and take one fourth part thereof for the fide of a Square equal there to: But this is false, though most Menuseit, Custom having made it bear the face of Truth: For it is more in measure than in reality it should be, by about one fifth part.

But the exact way of measuring of Round Timber (especially if it be growing) is this: About the middle

thereof,

thereof, in some smooth place, girt the same about with a String: Then have you this Proportion;

As 1000,

is to the number of Inches about;
So is 2821,

to the length of the fide of a

Square equal thereunto

So if a Tree being girt about, as above said, shall contain in circum-

ference 47 Inches, 13 parts.

If you extend the Compasses from 1000 to 47 Inches, 13 parts, the same extent will reach from 2821, to 13 Inches, 29 parts, which is equal to the side of a Square equal to that Tree; which being obtained, the Tree may be measured divers ways, according to the Examples in the last Chapter.

ald be, by about one is the pairty

CHAP. XIX.

Concerning the measuring of Regular Solids, or Cylinders, Globes, Cones and such like,

I. Of the CYLINDER.

A Cylinder is a round Figure, of equal Circumference in all parts thereof, as a standing Pillar, a Rowling-stone for Garden-walks, C. To measure such a Figure there are several ways, both by having the Circumserence given when it is standing, or by having the Diameter at the end thereof when it is lying, or by having the side of a Square equal to the Base thereof.

I. By having the Diameter given.

Example 1. The Diameter being 15 Inches, how much in length makes a Foot ?

As 15 the Diameter, And the

to 46.90:

Sois I,

I. Of the CILLI to a fourth;

And that fourth,

to 9.78, the length of a Foot.

Extend the Compasses from 15, the Diameter, to 46.90: That extent will reach from 1 to another Point upon the Line, and from thence to 9 Inches, 78 Parts, the length of a Foot folid. gaived v. 10

the end thereof when Example 2 The Diameter being t Foot, 25 Parts, bow much in length makes a Foot in Foot-measure.

As

(99)

As 1.25, the Diameter in Feet, to 1.128: por most forest from

So I.

to a fourth Number;

And that.

to 8.14, the length of a Foot

folid in Foot-measure.

Extend the Compasses from 1.25, the Diameter, to 1/128; the fame will reach from I to fome other Number, and from thece to 1 Foot, 128 parts of a Foot, the length of a Foot folid.

Example 3. Having the Diameter, 15 Inches, and the length, 105 Inches; how many folid Inches doth the Cylinder contain? will reach from

As 1.128.

to 15 Inches, the Diameter; So is ros Inches, the length,

to a fourth Number;

And that,

to 18555.34 Inches, the Content.

Extend the Compasses from 1.128 to 15, the length; the same extent will reach from 105, the length, to some other Number, and from thence to 18555.34 Inches, the Content of the Cylinder in Inches.

Example 4. Having the Diameter 1
Foot, 25 parts, and the length 8 Foot,
75 parts, to find the Content in Feet.
As 1.128.

to 1.25, the Diameter:

So is 8.75, the length,

And that fourth,

to 10.74 Foot the Content.

Extend the Compasses from 1.128 to 1.25, the Diameter; the extent will reach from 8.75, the length, to some other Number, and from that to 10 Foot, 74 parts, the content.

Example 5. Having the Diameter 15 Inches, and the length 105 Inches, bow many Foot doth it contain?

(101) As 46:90. to 15 Inches, the Diameter; So is 105 Inches, the length, to a fourth:

And that fourth,

to 10 Foot, 74 parts, the content. Extend the Compasses from 46.90 to 15, the Diameter: That extent will reach from 105, the length, to another Number, and from that to 10 Foot, 74 parts the content.

Example 6. The Diameter being 15 Inches, and the length & Foot, 75 parts, how many Foot doth it contain?

As 13.54, to is Inches the Diameter:

So 8.75 Foot, the length, to a fourth :

And that fourth,

to 10.74, the length in Feet.

Extend the Compasses from 3.54 to 75, the length; that extent will reach from 8.75, the length, to another Number, and from thence to 10. 10.74 Foot, the Content in Feet.

II. By having the Circumference given.

Example 1. The Circumference of a Cylinder is 47 Inches, 13 parts; how much thereof in length shall make a Foot Solid !

As 47.13 Inches, the Circumference, to 147.36: 00 adi ani 140 1009 of

So 1, to a fourth Number:

And that,

to 9.78. Inches, the length of a Foot.

Frample 6.

Extend the Compasses from 47.13, the Circumference, to 147.36: that extent will teach from 1 to a fourth Number, and from thence to 9 Inches, 78 parts, the length of a Foot folid.

Example 2. Having the Circumference of a Cylinder, 3 Foot 927 parts, to find the length of a Foot solid thereof in Foot-measure. As

As 3.927 Foot, to 3.545: So I.

to a fourth Number:

And that.

to 815 parts of a Foot, the length."

Extend the Compasses from 3.927 the Circumference, to 3.545: that extent will reach from 1 to some other Number, and from thence to 815 parts of a Foot, for the length of a Solid Foot of that Cylinder.

Example 3. The Circumference of a Cylinder being 47 Inches, 13 parts and the length thereof 105 Inches, How many Inches are there in fueb a Cylinder ? . . 21100 AT . 1007 OI OI

As 3.545,

to 45.13, the Circumference;

So 105 Inches, the length, to a fourth Number : 6 02 mignos

And that, to 18555, the Content in Inches . . .

Extend

Extend the Compasses from 3.545 to 47.13, the Circumference; that extent will reach from from 105, the length, to another Number; and from thence to 18555, the number of solid Inches in the Cylinder.

Example 4. The Circumference being 47 Inches, 13 parts, and the length 105 Inches (as before); How many folid Foot in that Cylinder?

As 147.36,

to 47.13 Inches, the Circumference:

So 105 Inches, the length, to a fourth Number:

And that,

Extend the Compasses from 147.
36 to 47.13, the Circumference that extent will reach from 105, the length, to another Number; and from that to 10 Foot, 74 parts of a Foot, the solid Content.

Example 5. Let the length of the Cylinder be 8 Foot, 75 parts, and the Circumference 3 Foot 927 parts t How many Foot doth it contain?

As 4.545,

to 3.927 Foot, the Circumfer rence:

So 8.75 Foot the length, to a fourth Number:

And that,

to 10 Foot, 74 parts, the Content. Extend the Compasses from 3.545, to 3.927: The same extent will reach from 8.75, the length, to 10.74, the content in Feet.

Example 6. Let the Circumference given be 47 Inches, 13 parts, and the length 8 Foot, 75 parts: How many folid Feet doth the Cylinder contain?

mos sie F

As

As 42.54, to 47.13 Inches, the Circumference:

So is 8.75 Foot, the length, to a fourth,

And that fourth,

to 10.74 Foot, the Content.

Extend the Compasses from 42.54 to 47.13, the Circumference: that extent will reach from 8.75, the length, to another Number, and from thence to 10 Foot, 74 parts, the Content of the Cylinder in solid Feet.

III. By having the side of a Square, equal to the Base or End of a Cylinder.

Example. Let the side of a Square, equal to the Base or End of the Cylinder, be 13 Inches 29 parts, and the Length thereof 150 Inches; How many square Feet are contained in that Cylinder?

As

As 41.57,

to 13.69 Inches, the fide of the Square:

So is 105, the length in Inches, to a fourth Number:

And that,

of the Cylinder in Feet, and

parts.

Extend the Compasses from 41.54, to 13.29 Inches, the side of a Square equal to the Base of the Cylinder; that extent will reach from 105 Inches, the length, to another Number, and from thence, to 10 Foot 47 parts, the Content of the Cylinder in Feet.

II. Of the CONE.

A Cone is a round Figure, having for the Base thereof a Circle, the Side whereof riseth from the Circumsetence of the Circle round about the same equally, till it meet in a point just over the Centre of the Circle,

and is in the form of a Spire-steeple.
And it is thus measured.

Example 1. Let there be a Cone, the Diameter of whose Base is 10 Inches, and whose Height is 12 Inches, I would know how many solid or Cubical Inches are contained therein?

The Diameter being 10, the Content of the Circle or Base will be found to be 78 Inches, 54 parts, last by the fifth Example in Chap. 13. of this Book.

The Area of the Base being thus found, the Proportion is, As 2.

to 78.54 Inches, the content of the Base:

So is 14 Inches the Height,

Inch, for the content of the Cone in Inches.

Extend the Compasses from 3 to 78.54, the Base; that extent will reach from 12 the height, to 314 Inches, 16 parts, the content of the Cone in solid Inches. Ex-

Example 2. Let the Diameter of the Base be 12 Inches, as before, and the length of the Side be 13 Inches: How many solid Inches are there in this Cone?

1. Extend the Compasses from 1 to 5 Inches, half the Diameter of the Base; that extent will reach from 5 to 25.

2. Extend the Compasses from 1 to 13, the length of the Side; that extent will reach from 13 to 169.

3. From this 169, take the 25 before found, and there remains 144.

4. Upon your Line take half the diflance between 1 and 144 and you shall find it to be 12: which 12 is the height of the Cone: So the height being had, you may find the Content, as in the last Example.

A Spherical Body is such a Body whose Superficies in all the parts of it are equally distant from the Centre of the Body, as Globes, Bullets, &c. Exam-

Example 1. The Circumference of a Globe or Bullet, being 28 Inches, 28 parts to find the length of the Diameter.

As 22, to 7: So is 28.28, the Circumference, to 9 Inches the Diameter.

Extend the Compasses from 22 downwards to 7: The same extent will reach from 28.28, the Circumference, downwards to 9 Inches, the length of the Diameter of that Bullet.

Example 2. The Diameter of a Spherical Body being given in 9 Inches, and its Circumference is 28 Inches, 28 parts: How many square Inches are there in the Superficies of that Spherical Body?

carre of the Body, as Glebes, Bul-

maxi

As 1,
is to 9 Inches the Diameter,
So is 28.28 Inches, the Circumference,
to 244.5 Inches, the Superficial
Content.

Extend the Compasses from 1 to 9, the Diameter: The same extent will reach from 28.21, the Circumference, to 254 Inches, 5 Parts, the superficial Inches in this spherical Body.

Example 3. The Diameter of a Spherical Body being 9 Inches, how many folid Inches are therein contained?

is to 9, the Diameter:
So is 9,
to a fourth Number:
And that fourth Number,
to 729, the Cube of the Diameter.

CHAR

2. As 9, the Diameter, to 729, its Cube: So is II.

to 891 Inches, the folid content of the Spherical Body.

Extend the Compasses from 1 to 9, that extent will reach from 9 to 81, and from 81 to 729, the Cube of the Diameter. Then extend the Compasses from 9, the Diameter, to 729 its Cube; that extent will reach from 11 to 891 Inches, the folid content of the Spherical Body.

I might here add the manner how to measure other kinds of Bodies, both regular and irregular; as Ellipses, Parabolas, &c. Alfo of Prisms, Scalenes, Cones, Spherodies, &c. But these being out of the reach of ordinary Artificiers, for whose sakes this Treatise was chiefly composed, I shall here conclude this Treatise of the Use of the Line of Proportion, with a short Supplement of Gauging of Vessels.

CHAP.

SUPPLEMENT.

CHAP. XX.

Concerning Gauging of Vessels by

Before you can measure your Vessel, to find the Content thereof in Gallons or Parts, you must find the Content thereof in Inches; and to effect this, you must find the Content of the two third parts of a Circle, agreeable to the Diameter at the Bung: And one third part of another Circle, agreeable to that of the Diameter at the Heads; these two added together, and multiplied by the length of the Vessel, that Product will be the Content of that Vessel in Inches.

EX-

EXAMPLE,

Let there be SDia. at Head, 183 In-aVessel whose Length is 40 ches. And let the Content thereof, first in Inches, and then in Gallons, be required.

I. For the two third parts of the Circle at the Bung.

As I,

to this univerfal Number [5236:] So 1024, the square of the Diameter at the Bung 32,

To 5.36.166 Inches, which is two third parts of the Content of the

Circle at the Bung.
Wherefore, Extend the Compasses from 1, to 5236, the same extent will reach from 1924 (the square of 32, the Diameter at the Bung) to \$36.166 Inches, the Content of 2 third parts of the Circle at the Bung in Inches. II. For II. For one third Part of a Circle
at the Head.

As 1, to this general Number [2618:] So is 324, the Square of the Diameter at the Head 18,

to 84.823 Inches, which is one third Part of the Content of the Circle

at the Head.

Wherefore, Extend the Compasses from 1 to 2618; the same extent will reach from 324 (the Square of 18, the Diameter at the Head) to 84.823 Inches, the Content of one third part of the Diameter at the Head in Inches.

III. For

anol asrioni

IV For

III. For the number of square Inches in the Vessel.

Add thefe two Numbers __ 536. 166 and __ 84. 823

They make-620. 689

And so many square Inches are contained in such a Vessel, whose Diameter at the Head is 18 Inches, at the Bung 32 Inches, and is 40 Inches long.

HA.A.

By this Work you parts of Wineparts, of Alemeafure.

How to multiply and divide by the Line, is taught in the Second and third Chapters of this Book, and therefore it were needless here to repeat it again: But I chose

chose rather to do it Arithmetically, for the better Illustration, and for the Satisfaction of such as have a Delight in Numbers.

More, concerning Gauging by
the Line.

All close Casks or Vessels, are near to one or other of these Forms; viz. Cylindrical, Spheroidical, Parabolical, Conoidal, or Conical: Every of which, (before it can be Gauged) must be reduced to the Cylindrical Form: By finding out a Mean Diameter, between the Diameters of the Head and Bung of the Vessel; for the effecting whereof, for most Ordinary Casks, the following Direction is a ready

Aufour Diameter Diameter, that Cask, to be 27.8 Inches.

reace, to 9.8 Inches, which added

chole rather a L U A heldemerical.

As 10, is to 7, So is the Difference of the Diameters of the Head and Bung of the Cask:

To a Number; which added to the Lesser Diameter of the Cask shall give you the Mean Diameter for that Cask.

of which, (below i can be Gaused)

Let the Diameter at the Head, be 18 Inches; at the Bung 32: Their Difference is 14: And let the mean

Diameter be required.

Extend the Compasses from 10 to 7; the same extent will reach (the same way) from 14, the Difference, to 9.8 Inches, which added to 18 Inches, the lesser Diameter, gives the Mean Diameter for that Cask, to be 27.8 Inches.

But

But if the Cask be near a Gylindrical Form, you may take the Proportion to be; As 10 to 8,

But if near to a Cronical Form, then the Proportion may be as 10

to 5.30.

Or, if it be in a Parabolical or Oval Form, then the Proportion

may be taken to be, As 10 to 6.

And for Casks whose Staves swell out very much, you may use these several Proportions, as you find them to tend more or less Spherical, viz.

As 10, $to \begin{cases} 7.3 \\ 7.4 \end{cases}$ so the difference

To a fourth Number; which added to the lesser Diameter, will give v you the Mean Diameter proper for that Cask.

if the Carb may be found, by

The Mean Diameter being thus found, the Area of the Circle may be found as in Chapter XIII. Or by this Proportion:

As 10, Is to the Mean Diameter: So is 78.54, (always) to the Area of the Circle.

EXAMPLE.

So the Mean Diameter being 27.8

Inches,

Extend the Compasses from 10 to 27.8 (the Mean Diameter) the same extent will reach (the same way) from 78.54 to 218.3, and from thence to 621;

And that is the Area of the Cir-

cle in Square-Inches. And,

This Area being found, the Content of the Cask may be found, by this Proportion.

As

As I,

Is to the Area of the Circle in Inches:

So is the length of the Cask in

Inches,

To the Content thereof in folid Inches.

EXAMPLE.

So the Area of the Circle being 621 Inches; and the length of the

Cask 40 Inches.

n-

As

Extend the Compasses from a to 621, the Area of the Circle in Inches, the same extent will reach (the same way) from 40 (the length of the Cask in Inches) to 25000 Inches, for the Content of the Cask in solid Inches.

And this being known, the Content in Wine or Ale-Gallons may be

found by this Proportion.

(124)

As 231 (for Wine;) or 282 (for Ale sent to wanh out or a

is to I;

So is the Content of the Cask in folid Inches; To the Content in Gallons.

EXAMPLE

So the Content of the Cask in folid Inches being 25000.

Extend the Compasses from 231, (for Wine) downwards to 1; the fame extent will reach (the fame way) from 25000 (the folid Inches in the Cask) to 107.5.

And fo many Wine-Gallons doth that Cask contain. apriont bilot ni

and this being known, the Can-

are in Wine on Ale-Gallens may be , on I by this I roportion. Or,

Extend the Compasses from 282, (for Ale) downwards, to 1; the same extent will reach the same way, from 25000 to 88:

And so many Ale-Gallons doth the

Cask contain.

Deathn from the Centre of a

Two-Foot From-Rule.

Propertions that tray be read to be read to

G 3 How

And whereas this Line of equal Parts is numbered from the Centre of the How to measure

Board, Glass, Timber,

(for Ale) downwards, to i , the lame exword illonord the fame way, from 25000 10 88:

And so many Year allows does the

Cask contain

A Line of equal Parts,

Drawn from the Centre of a

Two-Foot foint-Rule.

A LL Proportions that may be be wrought upon a straight Ruler by the Line of Proportion or Numbers, the same may be wrought by a Line of equal Parts, drawn from the Centre of an opening Joint.

And whereas this Line of equal Parts is numbered from the Centre of the

the Rule towards the end thereof, by 1, 2, 3, 4, &c. to 10; that these Figures (as in the other Line) do sometimes signify themselves only, sometimes 10, 20, 30, &c. sometimes 100, 200, 300, &c. according to the quality of the Question pro-

pounded.

Bur this Line you may also multiply, divide, work the Rule of Proportion, and perform divers Things which the Line of Numbers performeth, and some others which that will not; but I shall here only shew you how Board, Glass, Timber, Stone, &c. may be thereby measured; which I shall do in these following Proportions. And,

G 4

year Compaties the defeate between

L. For

I. For SUPERFICIAL-MEASURE, as Board, Glass, &c.

I. In INCH-MEASURE.

PROP. I.

A Plank being 27 Inches broad, and 263 Inches long, how many square Inches are contained therein

As 1: to 27:: So 263: to 7101.

Take in your Compasses the distance from the Centre, to 27 (the breadth) upon your Line of equal Parts; with this distance set one Foot in 10, at the end of the Line, and open the Rule till the other Foot fall in 10, on the other Leg of the Rule.

The Rule thus standing, take with your Compasses the distance between 263, on one Leg of the Rule, to 263, (129)

on the other Leg; this distance will reach from the Centre of the Rule to 7 rot; and so many square Inches are in that Piece.

PROP. 2.

If a Board, or Plank, or piece of Pavement, or of Glass, be 20 Inches broad, how much thereof in length shall make a Foot square?

As 20: to 144 : So 1: to 7.2.

Take 144, out of your Line of equal parts from the Centre, and fetting one Foot in 20, open the other Leg till the other Compass-

point fall into 20 alfo.

The Rule thus standing, take the distance between 10 and 10, and that distance will reach from the Centre of the Rule to 7 Inches 13 parts of an Inch ; and so much in length will make a Foot-square.

G 5

H.

II. In FOOT-MEASURE

PROP. 3.

A Room is 52 Foot broad, and 110.5
Foot long; How many Square Foot
are there in that Room?

As 52 : to 10 :: So 110.5 : to 57.

Take in your Compasses 52, the breadth; with this distance open the Ruler in 10, and 10; it so resting, taking the distance between 110.5 and 110.5 on every side; there distance applied to the Centre of the Rule will reach to 5746, and so many square Foot are in that Room.

PROP 4

A Plank being 2 Foot 25 parts broad, how much in length thereof shall make a Foot square?

As As 2.25, the breadth, is to 1, or 10:
So is 10, to 44, the length of a Foot.

Take in your Compasses the distance from the Centre of your Rule to 1; then set 1 Foot in 2.25, and open the other Leg till the other Compass point fall in 2.25, on the other side: The Rule thus standing, take the distance between 10 and 10; that distance applied from the Centre of the Rule, will reach to 44 parts of a Foot; and so much in length will make a Foot.

III. In TARD- MEASURE

PROP. 5.

1. In

I. In INCH-MEASURE.

PROP. I.

A Piece of Timber being 30 Inches broad, 21 Inches, 6 parts deep, and 183 Inches long; How many Foot are contained in that Piece of Timber?

1. As 1: to 30 :: So is 21.6. to 641]

Take the distance from the Centre, to 30; then set one Foot in 10, and open the Rule till the other Compass-point sall in 10, on the other Leg of the Rule: Then take the distance between 21.6, and 21.6; that distance will reach from the Centre of the Rule to 648, the Content of the Base or end of the Piece of Timber in Inches: Then,

thall here find them

Il 68.62 parts, to the Pie

2. As 1928, the number of Inches in a Foot folid,

Is to 648, the Content of the

So are 183 Inches, the length,
To 68 Foot, 62 Parts the Content in Feet.

Take in the Compasses the distance from the Centre to 1728; with this distance set one Foot in 648, and open the other Leg of the Rule, till the other point of the Compaffes fall in 648, on the other Leg, then take in your Compasses the distance from the Centre, to 183 : bu with this diltance move both Points of the Compasses gently along on both the Lines, on either fide of the Rule, till the Compass-points rest upon one and the fame Number on either Leg, which you shall here find them to do at 68.62 parts; fo the Piece containeth. taineth 68 Foot, and 1: parts of a Foot.

This kind of Work may feem troublesome at first; but a little Practice will render it easy

Note, If you take the first Number of your Proportion from the Centre of your Rule, you must take your third Number thence also hand then will your Number sought be found, as here in this Example. But if you take your first Number cross the Rule, then your third Number must be so taken also and your Number sought must be taken from the Centre, as those before were.

in cen is and is, that distance ap-

to reliting, take the different be-

s to charp R O P. 2. 86 france

If a Stone be 30 Inches broad, and 21 Inches, 6 parts deep; How much in length of that Stone will make a Foot square?

You must first find the Content of the Base, as is before taught; and it will be 648 Inches: Then,

As 648, the Content of the Base, is to 1728, the Inches in a solid Foot:

So is r,
To 2-67 parts

Take 1728 in your Compasses from the Centre: With that extent open the Rule from 648 to 648: the Rule so resting, take the distance between 10 and 10; that distance applied to the Line from the Centre, shall shall reach to 2 Inches, 67 Parts; and so much in length will make a Foot solid of that Stone or piece of Timber.

II. In FOOT-MEASURE.

PROP. 3. 3. 3.

If a Stone or piece of Timber be 2 Foot, 50 Parts broad, 1 Foot 80 Parts deep, and 15 Foot, 25 Parts long; How many folid Foot doth that Piece contain?

is to 2.50, the breadth;
So is 1.80, the depth,
to 4.50, the Content of the Base
in Feet.

Take 2.50 in your Compasses from the Centre; with that extent open the Rule in 10 and 10; then take the distance between 1.80 and 1.80, that (138)

extent will reach from the Centre of the Rule, to 4 Foot, 50 Parts, the Content of the Base.

2. As 1,

So 15.25, the length, to 68.62, the Content in Feet.

Take 4.50, in your Compasses, and thereto open the Rule from 10 to 10, then take the distance between 15.25, and 15.25: That distance will reach from the Centre of the Rule, to 68 Foot, 62 Parts, the Content of the Stone.

PROP. 4.

The breadth being 2 Foot; 50 parts, the depth 1 Foot, 80 parts; How much in length thereof will make a folid Foot?

You the letter to and the call of You

You may find the Quantity or Content of the Base (by the first of the last Proportion) to be 4 Foot, 50 Parts: Then,

As 4.50, the Base, is to 1;
So is 10, or 1 Foot, to 222 Parts.

Open the Compasses from the Centre to 1: Then setting one Foot in 4.50, open the other Leg till the Compass-point salleth in 4.50. on the other Leg, then take the distance between 10 and 10; and that will reach from the Centre to 222; and so many parts of a Foot will make a solid Foot of that piece of Stone or Timber.

PROP. 5.

To divide a Right Line into any number of equal Parts, at the first opening of the Compass. Let Let a Line be given to be divided into 6 equal Parts: Take the length of the Line given in your Compaffes: Then because it is to be divided into 6 Parts, put one Foot in 6, on one Leg, and open the other Leg till the other Point sall on 6, on the other Leg. The Rule thus standing, take the distance between 1 and 1; that distance shall divide your given one into 6 equal Parts. The like 1 any other Number of Parts what here.

Many other Conclusions may be done by this Line: But I shall referve them, and divers other Conclusions of the like nature, to a more convenient Place.

the of an eliteric artificial paper.

The USE of the

LINE of Proportion,

IMPROVED;

By which Board, Glass, Land, Wainfoot, Hangings, Pavement, Brickwork, Tyling, Plaistering, and any other Superficial; As also Stone, Timber, and other Solid Measure, may be measured without the use of Pen, Ink, Paper, Compasses, or other Motion (as sliding, or the like) what soever, by Inspection, only by looking upon the Line.

The ARGUMENT.

Am not ignorant how many have written of the Use of this Line of Proportion fince the Invention of Loga-

Logarithms, from which Trables this Line is constituted, and made; as namely ; after Mr. Gunter's first Contrivance, Mr. Wingate seconded him, in making divers Lines to feveral Radius's, thereby to bring it to exact the Square and Cube-Roots, without doubling or trebling, or dividing the distance into two or three Parts. Again, Mr. Will. Oughtred difposed of these Logarithmical Numbers in divers concentrick Circles, to be used with an opening Sector to turn upon the common Centre, thereby to work Proportions ; and hath written the Uses thereof in his Treatife, intituled, The Circles of Proportion. But nothing here here could be done without the help of the Compasses.

Again, one T. Broton, a maker of Mathematical Instruments, made it in a Serpentine of Spiral Line, composed of divers concentrick Circles, thereby to enlarge the division, which was

was the Contrivance of one Mr. Milbown, a Torkshire Gentleman, who writ thereof, and communicated his Uses to the aforesaid Mr. Brown, who since his Death attributed it to himself; but whoever was the Contriver of it, it is not without Inconvenience, for it can in no wise be made portable; and besides (instead of Compasses) an opening Joint with Thirds must be placed to move upon the Centre of the Instrument (as in the former Contrivance of Mr. Oughtred) without which no Proportion can be wrought.

There is yet a third way contrived, by which this Line is made very ferviceable and convenient both for Use and carriage, and is to be used without Compasses, and it is composed of two Lines of one length upon either side of two Rulers, to side one by the side of the other, the uses whereof in the measuring of Board, Glass, Timber, Stone, &c. and in other parts of Geo-

Geometry, Astronomy, Fortification, Trigonometry, Geography, Navigation, Gauging, Dialling, &c. together with the Uses of the Lines of Artificial Sines and Tangents, in the same manner contrived, all upon one Ruler, are largely written upon by Mr. Seth Partridge, in a Book of his lately published, entituled, The Description and Use of the Double-Scale of Proportion.

There is yet another way of difposing of this Line of Proportion,
by having one Line of the sull length
of the Ruler, and another Line of
the same Radius, broken in two
parts between 3 and 4; so that in
working your Compasses never go
off of the Line. This is one of the
best Contrivances; but here Compasses must be used.

These are all the Contrivances that I have hitherto seen of these Lines: That which I here speak of, and will shew how to use, is only two Lines

100

upon

upon a plain Ruler of any length (the larger the better) having the beginning of one Line at the end of the other, the Divisions of each Line being set so close together, that if you find any Number upon one of the Lines, you may easily see what Number stands against it in the other Line: This is all the Variation: And what this easy Contrivance will essect, will appear by the Uses following.

The Lines are the same with the Line of Proportion or Numbers, mentioned and treated of in the former part of this Book: And therefore how to number upon them is shewed in the 1st Chapter of this Book, and therefore needs not here again to be repeated: Also Multiplication, Division, the Golden Rule, Duplicated and Triplicated Proportion, the Extraction of Roots, &c. delivered in the second.

third, fourth, fifth Chapters, &c. as also in measuring of Superficies and

Solids.

Solids, and the Mensuration of other Figures treated of through the whole Rook, these Lines thus disposed will effect with Compasses: But some of those Uses which they will effect in measuring without the help of Compasses, I will here shew.

CAUTION.

What Measure soever you measure by, let the Integer or Grand Measure be divided into 10 or 100 parts (it matters not of what length your Lines of Proportion be, for to them all Measures are alike.) Thus, if you measure any Thing by the Foot, let your Foot be divided into 100 parts: If by the Yard divide your Yard into 100 parts: If by the Ell, divide that into 100 Parts. So likewise if by the Perch, Rod, &c. or by what Measure soever, let the Grand Measure (as I said before) be divided into 100 parts.

CHAP. I.

OF SUPERFICIAL MEASURE

BY Superficial Measure is meant all kinds of flat Measure, such as in Board, Glass, Pavement, Hangings, Plaistering, Tyling, Land-measure, &c. And these several Things are measured by distinct Measures, as some by the Foot, others by the Tard, others again by the Ell, some by the Rod, and some by the Square: Of all which I shall give Examples: And,

I. Of FOOT-MEASURE.

Example 1. If a Board be 1 Foot, 64 parts broad, how much in length of that Board, will make a Foot squar?

H 2 Look

Look upon one of your Lines (it matters not which) for 1 Foot, 64 parts, and right against it on the other Line, you shall find 61; and so many parts of a Foot, will make a Foot square of that Board.

Example 2. A Plank is 3 Foot, 50 parts broad, how much thereof in length will make a Foot?

Find 3 Foot, 50 parts upon one Line, and right against it on the other Line, you shall find 28 parts and, or something more than half a part; and so much in length will make a Superficial Foot.

example 3. If a Board be 75 parts of a Foot broad, bow much thereof in length shall make a Foot square?

Look

Look

Look upon one of your Lines for 75, and right against it you shall find a Foot, 33 parts, and so much in length makes a square Foot.

Note, if the breadth of any Thing given be more than one Foot, then the length of a Foot square must be less than a Foot, as in the two sirst Examples it was: But if the breadth given be less than a Foot (as in this last Example) then the length of a Foot square must be more than a Foot.

Example 4. A Pane of Glassis 35 parts broad; how much in length makes a Poot?

Find 25 in one Line, against it you shall find 2 Foot, 85 parts; and so much in length makes a square Foot.

H 3 Ex-

Example 5. A Pane of Glass is 3
Foot broad, How much in length
makes a Foot?

Find 3 Foot in one Line, against it in the other you shall find 33 to parts; and so much in length makes a Foot square.

Frample 6. If a piece of Glass be I Foot, 91 parts broad; How much in length will make a Foot?

Look 1 Foot, 98 parts in one Line, and against it in the other you will find 5 Foot and half a part; and so much in length makes a Foot.

II. OF TARD-MEASURE.

Example 1. A Gallery is Wainscoted 2 Yards, 56 parts deep; how much of that length will make a Yard square? Seek Seek 2 Yards, 56 parts in one Line, and against it on the other you shall find 39 parts and somewhat more; and so many parts of a Yard will make a Yard square.

Example 2. A Room is Wainscoted 1 Yard, 13 parts high; how much in length thereof will make a Tard square?

Look one Yard, 13 parts in one Line, against it in the other you will find 88 parts and above half a part; and so much in length makes a Yard square.

Example 3. If the Frieze about a Room be 62 parts of a yard broad; How much in length thereof will make a Yard square?

H 4

Find

Find

Find 62 parts in one of your Lines, and against it in the other, you shall find 1 Yard, 61 parts, and somewhat more; and so much in length makes a Yard square.

Example 4 There is a Gallery paved with Marble, being 5 Yards, 70 parts broad; how much of that in length will make a Yard Square?

Seek 5 Yards, 70 parts in one Line, and against it in the other, you shall find 17 parts and an half; and so much in length of that Pavement will make a Yard square.

Example 5. A Parlour being 7 Yards, 29 parts broad, hath a Cieling of Fret-work plaistered; How much of that breadth will make a Yard square?

Find

Find 7 Yards, 29 parts, in one of your Lines, and right against it in the other Line you shall find 13 parts, and 75, which is above half a part: So that 13 parts and a little more than half a part will make a Yard square of that Cieling.

Example 6. A Plaisterer hath Rendred the inside of a Wall containing 2 Yards, 36 parts in height; how much of that will make a Yard square?

Find 2 Yards, 36 parts in one of your Lines, and right against it, on the other you shall find 42 parts ? of a part, that is, fomething more than 1 third part of a part; and so much in length makes a Yard square.

III. Of MEASURE by the ELL!

Example 1. There is a Room hung with Tapestry, which is 4 Ell, 25, H 5 parts

parts high; How much Tapstery in length will make an Ell square?

Note, Here by Ells we understand Flemish Ells (for by that Meafure are Hangings fold;) which Ell contains three quarters of our Yard; that is, 75 parts of our Yard. So that if an Upholsterer have his Flemish Ell divided into 100 parts, he may measure his Hangings as in the Examples following is shewed.

Here because the Hangings are 4 Ells, 25 parts deep, Look for 4 Ells, 25 parts in one of your Lines, right against which in the other you shall find 23 parts and a half, and fo many parts of his Ell will make a Flemish Ell square. Example 1. There is a Reast burge

DEFTS

with Topelling bie is a Ell, 25

Example 2. The Embroidery of a pair of Vallens about a Bed is 28 parts of a Flemish Ell deep; How much of that Embroidery in length will make a Flemish Ell square?

Look for 28 parts in one of your Lines, and against it in the other Line you shall find 3 Ells, and 57 parts of an Ell; and so much in length will make an Ell square.

Example 3. A Gallery being 3 Ells 98 parts deep, is hung with Arras; How much of that depth will make an Ell square?

Seek 3 Ells, 98 parts in one Line, against which in the other you shall find 25 parts and of a part; and so much in length will make an Ell square.

IV. Of MEASURE by the ROD.

Example 1. There is a Brick-Wall, which is 75 parts of a Rod high; How much in length of that Wall will make a Rod square?

the Brick-layers measured by the Rod, which contains 16
Foot and an half in length:
Wherefore, let this Rod, being 16 Foot and an half in length;
be divided into 100 equal parts, and then let him work as followeth.

The Wall being 75 parts of a Rod high, Look for 751 parts in one Line, and in the other Line right against 75, you shall find one Rod, 33 parts of a Rod; and so much of that Wall in length is contained in a square Rod.

Ex-

Example 2. A Carpenter bath Railed and Paled in a Garden with Pales 52 parts of a Rod high; How much of that Pailing shall make a Rod fquare?

Seek 52 parts in one Line, against it in the other Line you shall find 1 Rod, 92 parts; and so much in length will make a square Rod of that Paling.

Example 3. A Brick-layer hath made a Sewer to carry Water; the Bottom, Sides and Arch together contain 1 Rod, 64 parts; How much of that Drein or Sewen makes a square Rod?

Find 1 Rod, 64 parts, in one of your Lines, and right against that Number you shall find in the other Lines almost 61 parts; and so many parts of a Rod in length will make a Rod square.

And

And here note, That though I have here put these two last Examples, that Paling is not measured by the Square Rod, but (let the height thereof be what it will) it is measured by the Rod in length: In like manner is Hedging, Ditching, and many other Things that are measured by the Rod.

Example 4. If a piece of Land be 2
Rod, 31 parts broad, how much in
length thereof shall make a Rod
fquare?

Seek 2 Rods, 31 parts upon one of your Lines, and over-against it upon the other Line you shall find 42 parts and about 2 of a part; and so much in length makes a square Rod.

Example 5. A Piece of Land being 80 parts of a Rod broad a How much thereof in length shall make a Rod square?

Look for 80 parts in one Line, and in the other Line opposite thereunto you shall find 1 Rod, 23 parts and so much in length makes a Rod square

V. Of MEASURING by the SQUARE.

There are two Things principally which are measured by the Square, and they are Tyling of Houses, and Flooring of Rooms; and in this reckoning the account a Square to be 10 Foot every way: So that for this kind of Measure divide a Line or Rod of 10 Foot long into 100 parts, and it is fit for the purpose.

example 1. A Barn, the breadth of the Tyling whereof on both Sides is 1 Square, 30 parts; How much in

in length of that Tyling will make a square?

Find I Square, 30 parts, upon one of your Lines, and right against it on the other Line you shall find 77 parts almost; and so much in length of that Tyling will make a Square.

Example 2. The Tyling of a House, is 76 parts of a Square broad; How much in length thereof will make a Square.

Seek 76 parts in one Line, and against it in the other you shall find a Square, 31 parts and a half almost: And so much in length will make a square Square, that is, 10 Foot every way, in all 100 Foot.

. The breadth of the both Sides is a square, 30 parts. How much

CHAP. II.

of SOLID- MEASURE.

Measure as hath Length, Breadth and Thickness; fuch as Timber, Stone, or the like. But before Timber or Stone can be measured, you must find the Content of the Square of the Base thereof, which is taught by the Problem at the end of the Tenth Chapter: But that being performed by Compasses, I will here shew how it may be (by these Lines thus disposed) performed without; and that shall be my first Proposition or Example.

er Stone, be 80 Parts of a Foot deep,

deep, and 3 Foot, 75 parts broad; How much in length of that Piece will make a Foot square?

Here (by any of the former Rules of Superficial Measure) find at 80 parts broad, how much in length will make a Foot, which you will find to be 1 Foot, 25 parts: For,

If you find 80 parts the depth of the Piece in one Line, against it in the other you shall find 1 Foot, 25 parts. Take 1 Foot 25 parts of your Foot Rule, and measure it along the breadth of the Piece, which is 3 Foot, 75 parts, and see how often it is contained therein, which you shall find to be three times: Wherefore, you may conclude that the Square of the Base of that Piece of Timber whose depth is 80 parts, and whose breadth is 3 Foot, 75 parts, is just 3 Foot.

Now the Square of the Base of the Piece being thus obtained, you may find the length of a Foot solid thereof in this manner.

Example 2. Let the Square of the Base of a piece of Timber or Stone be 3
Foot; How much in the length of that Piece will make a Foot solid?

Look for 3 Foot in one of your Lines, and in the other right against it you shall find 33 parts and 3 part of a part; and so much in length will make a Foot solid.

Example 3. Let a Piece of Stone or Timber be 2 Foot 50 parts broad, and 50 parts deep; how much of that Stone in length shall make a solid Foot?

By any of these ways before prescribed, you shall find that the depth of your your Stone being 50 parts, it will require 2 Foot in length thereof to make a Foot square: Wherefore, measure how often you can find 2 Foot in the breadth of your Solid, which you can find only once, and 50 parts more, which is one quarter of two Foot: Wherefore, the Square of this Solid contains 1 Foot, 25 Parts. Wherefore, Look in one of your Lines for 1 Foot, 25 parts, and right against it you shall find 80 Parts; and so much in length will make a Foot solid.

Example 4. The Square of the Base of any Regular Solid being given, together with the length of the same Solid; to find how many solid Feet are contained in the same.

Let the forementioned Solid serve for this Example also, whose length was 32 Foot: We found that the Square Square of the Base was a Foot, 2; parts, and that 80 parts in length would make one solid Foot: Wherefore, take 80 parts of your Rule, and run it along the Piece as often as you can, which you shall find to be 40. So that in this Piece of Timber there is 40 Foot.

I might add many more Examples this kind, and fome to other purposes; but these are sufficient for the Purpose intended. And so I shall conclude this Treatise, leaving the farther Practice thereof to yourself: For,

Usus optimus Magister.

Suggrandal Content, D. .. Bur I have

opening the Compalles to the differed given upon one Line, and applying the

CHAP.

CHAP. III.

OF CIRCULAR-MEASURE

By having either the Circumference or Diameter of any Circle given, thereby to find the Side of a Square equal to the same Circle; or the Side of a Square that may be inscribed within the same Circle.

IN the Thirteenth Chapter of this Book you have fix Examples, by having the Circumference or Diameter of any Circle given, thereby to find the Side of a Square equal to the Superficial Content, &c. But I have feen upon fome Two-foot Rules, Lines to effect this Thing, by only opening the Compasses to the distance given upon one Line, and applying the

the same to some of the other Scales: One of those Scales is noted at the end thereof with C, signifying the Circumference of any Circle: The other with D, signifying the Diameter: The other with S. E, signifying Square equal to the Circle: The other with S. W, signifying Square within.

Example. So that if I should have given you the Diameter of a Circle, being 15 Inches; out of the Line noted with D, take 15 Inches; apply that distance to the Line noted with C, it will reach to 47 Inches and 713 parts of an Inch: and so much is the Circumference of that Circle.

Again, the Diameter being 15 Inches, as before that that Distance out of the Line D, and it will reach upon the Line S. E, to 13 Inches parts: And that shall be the Side of a Square equal to the Circle whose Diameter is 15 Inches.

Again

Inches, if you take that distance out of the Line noted with D, it will reach upon the Line S. W, to 10 Inches 75; parts of an Inch: And that is the length of the Side of the greatest Square than can be drawn within that Circle whose Diameter is 15 Inches.

The like may be done, if the Circumference were given, by taking the Circumference thereof out of the Line noted with C, and applying

it to the other Scales.

This I thought covenient to add here, because sometimes these Lines are put upon Two-soot Rules.

Australia Diameter being it

s, as before thee that Differ ce
